

High-Side Measurement Current Shunt Monitor with Comparator

General Description

The RT6050/RT6052 devices are high-side current-shunt monitors which contain a current-sense amplifier, bandgap reference, and a comparator with latching output. The RT6050/RT6052 senses drops across shunts at common-mode voltages from 2V to 80V. The RT6050/RT6052 series supports two output voltage scales: 20V/V, and 100V/V.

The RT6050 and RT6052 build in an open-drain comparator and internal reference providing a 0.6V threshold. External dividers set the current trip point. The comparator features a latching capability, that can be made easily by grounding (or leaving open) the RESET pin.

The RT6050/RT6052 is available in a small 8-pins MSOP package.

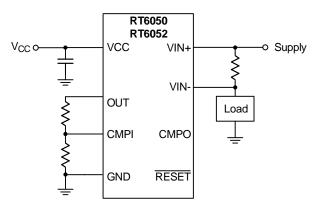

Features

- High Accuracy Current Sensing :
- 3.5% Maximum Error Over Temperature
- 2.9V to 18V Power-Supply Range
- Two Gain Options Available
 - ► RT6050 = 20V/V
 - ► RT6052 = 100V/V
- Common-Mode Range: 2V to 80V
- 0.6V Internal Voltage Reference
- Internal Open-Drain Comparator
- Latching Capability on Comparator
- Packages: MSOP-8

Applications

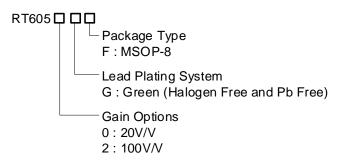

- Server, Storage and Network Equipment
- Portable, Battery-Powered Systems
- Point of Load (POL) Power Modules
- Notebook Computers
- · High End Digital TVs

Simplified Application Circuit

Ordering Information

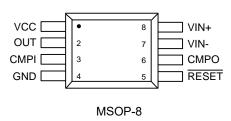

Note:

Richtek products are:

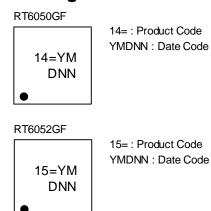

- ▶ RoHS compliant and compatible with the current requirements of IPC/JEDEC J-STD-020.
- ▶ Suitable for use in SnPb or Pb-free soldering processes.

Marking Information

DS6050/DS6052-01

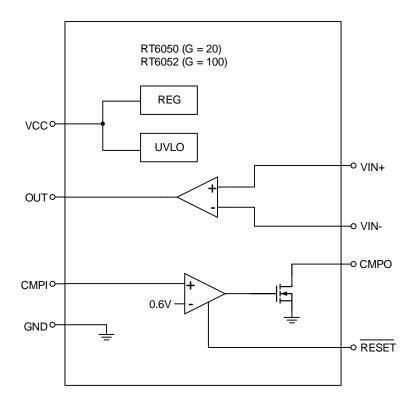

Functional Pin Description

Pin No.	Pin Name	Pin Function
1	VCC	Power input. Connect a 0.1μF capacitor as close to the VCC pin as possible.
2	OUT	Voltage output. Vout is proportional to Vsense (VIN+ – VIN-).
3	СМРІ	Comparator input. Positive input of an internal comparator. The negative terminal is connected to a 0.6V internal reference.
4	GND	Ground.
5	RESET	Reset input pin. Reset the output latch of the comparator, active low.
6	СМРО	Open-drain comparator output. Connect RESET to GND to disable the latch.
7	VIN-	Negative current-sensing input. Connect load side to external sense resistor.
8	VIN+	Positive current-sensing input. Connect power side to external sense resistor.

Functional Block Diagram

Operation

The RT6050/RT6052 devices high-side, are unidirectional, current-shunt monitors with a high common-mode input range from 2V to 80V. The devices are available with two output voltage scales: 20V/V and 100V/V, with up to 500kHz bandwidth. The over-current protection is also available by internal comparator; when the voltage at CMPI pin is higher than internal reference 0.6V, the CMPO pulls high to indicate overcurrent situation. Connect a divider from the OUT pin to CMPI pin to set the over-current trip point, the devices provide an open-drain comparator with a latching function that allows the output signal of comparator to be latched or non-latched by RESET pin setting.

Comparator and Reset

The RT6050/RT6052 devices incorporate an opendrain comparator. This comparator typically has $1.3\mu s$ (typical) response time. The output of the comparator latches and is reset through the \overline{RESET} pin. From Figure 1, the control logic is described as 3 stages.

Stage1. VCMPO goes high after VCMPI increases and eventually over 0.6V.

Stage2. When VRESET is high, VCMPO is kept high even VCMPI decreases and lower than 0.6V; when the VRESET goes low, VCMPO goes low as well.

Stage3. When VRESET is low, VCMPO goes high/low depending on VCMPI higher/lower than 0.6V.

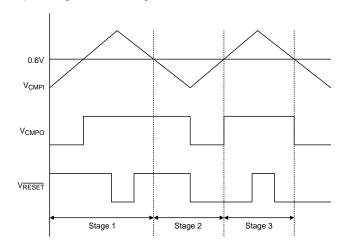

Figure 1. Comparator Latching and Reset Logic

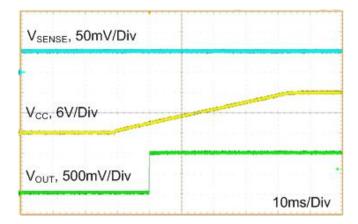

Power On

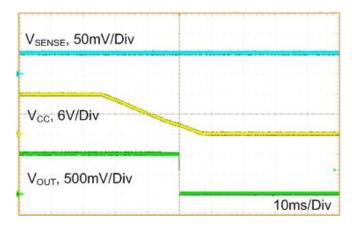

The RT6050/RT6052 implements power on reset (POR) function to prevent operation without fully turn-on the

RICHTEK

internal control circuit. When Vcc is increasing and eventually becomes higher than POR rising threshold (2.75V, typical), the device starts output voltage; in contrast, when Vcc is lower than POR falling threshold (2.55V, typical), the device stops output voltage.

Gain Error and Input Offset Voltage

Using two-step method to characterize gain error and offset voltage, first of all, the gain can be obtained by measuring different sense voltage.

$$G = \frac{V_{OUT1} - V_{OUT2}}{100mV - 20mV}$$

Where

- Vout1 = output voltage with Vsense = 100mV
- Vout2 = output voltage with Vsense = 20 V

Then the offset voltage is measured at VSENSE = 100mV, and referred to the input (RTI) of the current shunt monitor, as shown in Electrical Characteristics: Current-Shunt Monitor.

VRTI (Referred-To-Input) =
$$\left(\frac{V_{OUT1}}{G}\right)$$
 - 100mV

Application Information

Richtek's component specification does not include the following information in the Application Information section. Thereby no warranty is given regarding its validity and accuracy. Customers should take responsibility to verify their own designs and to ensure the functional suitability of their components and systems.

Selecting the Shunt Resistor

The selected value for the shunt resistor, RSHUNT, depends on the application and is a compromise between small-signal accuracy and maximum permissible voltage loss in the measurement line. High values of RSHUNT provide better accuracy at lower currents by minimizing the effects of offset, while low values of RSHUNT minimize voltage loss in the supply line. For best performance, select RSHUNT to provide approximately 50mV to 100mV of sense voltage for the full-scale current in each application. Maximum input voltage for accurate measurements is 500mV, but output voltage is limited by supply voltage Vcc.

Input Filtering

In some applications, the current being measured may be inherently noisy. In the case of a noisy signal, filtering after the output of the current sense amplifier is often simpler; however, this location negates the advantage of the low output impedance of the internal buffer.

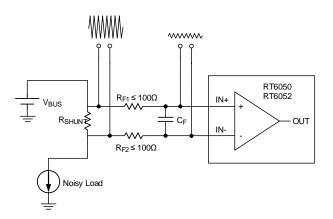

Figure 2. Input Filter

Other applications may require filtering at the input of the current sense amplifier. Figure 2 shows the recommended schematic for input filtering.

Input filtering is complicated by the fact that the mismatch between added resistance of the filter

resistors and the associated resistance can adversely affect gain, CMR, and offset voltage, Vos. The effect on Vos is partly due to input bias currents as well. As a result, the value of the input resistors should be limited to 100Ω or less.

Total Error Analysis

To optimize the design, the first is to analyze each error contributed; the main influences of sense voltage errors can be identified as follows:

- The tolerance of shunt resistor (RSHUNT)
- Sense offset voltage, Vos. When the sense voltage is small, especially low load current and small shunt resistance, the error is dominated by the input offset error.
- Gain Error, GE%
- PSR of offset voltage, PSR
- Common mode rejection, CMR
- The offset voltage caused by input bias current
- Nonlinearity Error, NLIN%

Max Output Error Estimation

Here is an example. The system bus voltage V_{CM_SYS} connects to VIN+ = 18V, system supply voltage V_{CC_SYS} = 5V, shunt resistor accuracy is 1%, $10m\Omega$ 1.5W, the load current is 10A. To set the design goals, the maximum output voltage errors are calculated in the following sections.

Input Offset Voltage Error

The rate of offset error in the total error can be estimated directly from the specification table. The input offset voltage is 2.5mV at $T_A = 25^{\circ}\text{C}$, the error due to offset can be obtained by the equation below :

$$V_{OS_err} = \frac{V_{OS(max)}}{V_{SENSE}} \times 100\% = \frac{2.5 mV}{10 m\Omega \times 10A} \times 100\% = 2.5\%$$

Copyright © 2022 Richtek Technology Corporation. All rights reserved.

www.richtek.com

Shunt Voltage Gain Error

From the electrical characteristics, the max gain error is 1%

PSR Error

The PSR error is to estimate the error caused by different supply voltage, the RT6050/RT6052 device specification gives the specified power supply voltage for the input offset voltage specification as Vcc ps = 2.9V, when the system supply voltage is not exactly 2.9V may result in an additional error. RT6050/RT6052 device gives the maximum PSR as 100µV/V. Calculate the PSR error by the equation below:

$$PSR_err = \frac{\left|V_{CC_DS} - V_{CC_SYS}\right| \times PSR}{V_{SENSE}} \times 100\%$$
$$= \frac{\left|2.9 - 5\right| \times 100 \frac{\mu V}{V}}{10m\Omega \times 10A} \times 100\% = 0.21\%$$

CMR Error

The CMR error means the input offset error is influenced by the variation of common-mode voltage. In real conditions, calculate the maximum input offset by determining the actual common-mode voltage as applied to RT6050/RT6052. According to RT6050/RT6052 device specification, it gives the common-mode rejection ratio minimum as 80dB $(100\mu V/V)$. The offset voltage in the data sheet is specified with a common-mode voltage, V_{CM} _{DS} that is 12V. To calculate the actual common-mode error at system bus voltage:

$$80dB = \frac{1}{10^{\left(\frac{80dB}{20}\right)}} \times 10^{6} \times \frac{\mu V}{V} = 100 \frac{\mu V}{V}$$

$$\begin{split} &CMR_err = \frac{\left|V_{CM_DS} - V_{CM_SYS}\right| \times CMR}{V_{SENSE}} \times 100\% \\ &= \frac{\left|12 - 18\right| \times 100 \frac{\mu V}{V}}{10m\Omega \times 10A} \times 100\% = 0.6\% \end{split}$$

Input Bias Current Error

The input bias current flows into shunt resistor to cause additional offset; this error is calculated with respect to the ideal voltage across the sense voltage.

$$I_{B_err} = \frac{I_B \times R_{SHUNT}}{V_{SENSE}} \times 100\% = \frac{13\mu A \times 10m\Omega}{10m\Omega \times 10A} \times 100\%$$
$$= 0.00013\%$$

Nonlinearity Error

The nonlinearity error shown in Figure 3 is the difference between an actual gain and the ideal value. For ideal cases, the voltage gain is constant over full sense ranges, but in the real application, the voltage gain is not exactly constant, the nonlinearity gain may cause additional errors. In the specification, the RT6050/RT6052 gives the nonlinearity error as 0.1% over sense voltage from 20mV to 100mV.

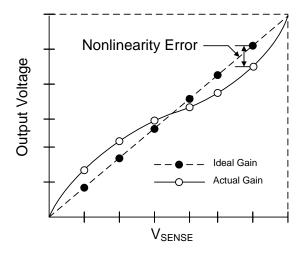

Figure 3. Nonlinearity Error

2022

Total Error

Use equation below to calculate the worst case of total error:

Total_err =
$$\sqrt{(GE\%)^2 + (R\%)^2 + (V_{OS_err})^2 + (PSR_err)^2 + (CMR_err)^2 + (I_{B_err})^2 + (NLIN\%)^2}$$

= $\sqrt{(1\%)^2 + (1\%)^2 + (2.5\%)^2 + (0.21\%)^2 + (0.6\%)^2 + (0.0013\%)^2 + (0.1\%)^2}$
= 2.94%

Layout Guidelines

- ▶ A Kelvin sense arrangement is required for best performance. Connect the input pins (VIN+ and VIN-) to the sensing resistor using a 4-wire connection.
- ▶ PCB trace resistance from the sense resistor to the VIN+ and VIN- pins can affect the power measurement accuracy. Place the sense resistors as close as possible to the RT6050/RT6052 and do not use minimum width PCB traces.
- ▶ Place the power-supply bypass capacitor 0.1μF as close as possible to the supply and ground pins.
