

Rail-to-Rail Quad Unity-Gain Operational Amplifier

General Description

The RT9136 consists of low cost, high slew rates, single-supply rail-to-rail input and output operation amplifiers. The RT9136 contains four amplifiers in one package.

Operating on supplies ranging from 4.5V to 16.5V, while consuming only 500µA per channel, the RT9136 has high slew rates (12V/µs), 35mA continuous output current, 120mA peak output current and offset voltage below 10mV. The RT9136 is ideal for Thin Film Transistor Liquid Crystal Displays (TFT-LCD), GAMMA Buffer or repair circuit.

The RT9136 is available in MSOP-10 package and is specified for operation over the full -40°C to 85°C temperature range.

Ordering Information

- RT9136 □ □
- Package Type
F : MSOP-10
 - Lead Plating System
P : Pb Free
G : Green (Halogen Free and Pb Free)
Z : ECO (Ecological Element with Halogen Free and Pb free)

Note :

Richtek products are :

- ▶ RoHS compliant and compatible with the current requirements of IPC/JEDEC J-STD-020.
- ▶ Suitable for use in SnPb or Pb-free soldering processes.

Features

- Rail-to-Rail Output Swing
- Unity gain buffer
- Supply Voltage : 4.5V to 16.5V
- Continuous Output Current : 35mA
- Peak Output Current : 120mA
- High Slew Rate : 12V/µs
- RoHS Compliant and 100% Lead (Pb)-Free

Applications

- TFT-LCD Gamma / V_{COM} Buffer
- Portable Electronic Product
- Communications Product

Function Block Diagram

Functional Pin Description

Pin No.	Pin Name	Pin Function
1	VOUTA	Amplifier A Output.
2	VINA	Amplifier A Input.
3	VS+	Positive Power Supply.
4	VINB	Amplifier B Input.
5	VOUTB	Amplifier B Output.
6	VOUTC	Amplifier C Output.
7	VINC	Amplifier C Input.
8	VS-	Negative Power Supply.
9	VIND	Amplifier D Input.
10	VOUTD	Amplifier D Output.

Absolute Maximum Ratings (Note 1)

- Supply Voltage between VS+ and VS- ----- 18V
- Input Voltage ----- -0.5V to Vs+0.5V
- Differential Input Voltage ----- Vs
- Power Dissipation, PD @ TA = 25°C
- MSOP-10 ----- 833mW
- Package Thermal Resistance (Note 2)
- MSOP-10, θ_{JA} ----- 120°C/W
- Lead Temperature (Soldering, 10 sec.) ----- 260°C
- Junction Temperature ----- 150°C
- Storage Temperature Range ----- -65°C to +150°C
- ESD Susceptibility (Note 3)
- HBM (Human Body Mode) ----- 2kV
- MM (Machine Mode) ----- 200V

Recommended Operating Conditions (Note 4)

- Junction Temperature Range ----- -40°C to 125°C
- Ambient Temperature Range ----- -40°C to 85°C

Electrical Characteristics

(VS+ = 5V, VS- = -5V, RL = 10kΩ and CL = 10pF, TA = 25°C, unless otherwise specified)

Parameter	Symbol	Test Conditions	Min	Typ	Max	Unit
Input Characteristics						
Input Offset Voltage	VOS	VCM = 0	--	2	15	mV
Average Offset Voltage Drift	$\Delta V_{OS}/\Delta T$	-40°C ≤ TA ≤ 85°C	--	5	--	μV/°C
Input Bias Current	IB	VCM = 0	--	2	50	nA
Input Impedance	RIN		--	1	--	GΩ
Input Capacitance	CIN		--	1.35	--	pF

Note 1. Stresses listed as the above "Absolute Maximum Ratings" may cause permanent damage to the device. These are for stress ratings. Functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may remain possibility to affect device reliability.

Note 2. θ_{JA} is measured in the natural convection at $T_A = 25^\circ C$ on a high effective thermal conductivity test board (4-Layers, 2S2P) of JEDEC 51-7 thermal measurement standard.

Note 3. Devices are ESD sensitive. Handling precaution is recommended.

Note 4. The device is not guaranteed to function outside its operating conditions.

Note 5. 16.5V is the correct allowable aging voltage; however, full electrical characteristics are specified with a single nominal supply voltage from 5V to 15V or a split supply with its total range from 5V to 15V.

Note 6. Slew rate is measured on rising and falling edges.

Applications Information

The RT9136 packaged in quad operational amplifiers has high performance to drive large load for different application. High slew rates, rail-to-rail input and output capability and low power consumption are the features to make the RT9136 ideal for LCD applications. The RT9136 also has wide bandwidth and phase margin to drive a load of 10kΩ and 10pF.

Operating Voltage

The RT9136 is specified with a single nominal supply voltage from 5V to 15V or a split supply with its total range from 5V to 15V. Correct operation is guaranteed for a supply range of 4.5V to 16.5V.

RT9136 specifications are stable over both the full supply range and operating temperatures of -40°C to 85°C . Parameter variations with operating voltage and/or temperature are shown in the typical performance curves.

The output swing of the RT9136 typically extends to within 80mV of positive/negative supply rails with 5mA load current source/sink. Decreasing the load current will get output swing even closer to the supply rails. Figure 1 shows the rail-to-rail input and output waveforms in the unit gain configuration without load current. The supply rails are $\pm 5\text{V}$. Applying an input 10Vp_p sinusoidal waveform results in a 9.8Vp_p output voltage as shown in Figure 1.

Short Circuit Condition

An internal short-circuit protection circuit is implemented to protect the device from output short circuit. The RT9136 limits the short circuit current to $\pm 120\text{mA}$ if the output is directly shorted to positive/negative supply rails. For reliability, the continuous output current more than $\pm 35\text{mA}$ is not recommended.

Unused Amplifier

If the amplifier is unused. It is recommended to connect the positive input to ground and keep the output pin as open.

LCD Panel Applications

The RT9136 is mainly designed for LCD gamma and V-com buffer. OP Amplifier-C has 120mA instantaneous source/sink peak current. To test the performance of the RT9136 for LCD driving capability, the test circuit is to simulate the V-com driver as shown Figure 2. Series capacitors and resistors connected to the output of the OP simulate the load of LCD panel. The 300Ω and 3kΩ feedback resistors are used to improve the settling time. This circuit is the worst case for a V-com buffer. Figure 3 shows the waveforms of the output peak current capability.
