Optically Isolated Delta-Sigma Modulator

DESCRIPTION

The RV1S9353A is an optically isolated Delta – Sigma Modulator that includes high-Accuracy A/D convertor and converts an analog voltage input into one-bit data stream. The RV1S9353A provides Effective Number of Bit (ENOB) is 13.8bits (typ) with a Sinc³ digital filter.

The RV1S9353A is designed specifically for high common mode transient immunity (CMR) and high linearity (nonlinearity). The RV1S9353A is suitable for current sensing and voltage sensing in motor drives.

FEATURES

- Internal Reference Voltage Tolerance (GE = ±0.5 % TYP.)
- Effective Number of Bit (ENOB = 13.8 bits TYP.)
- Operating Ambient Temperature (TA = -40 to 110 °C)
- Non-linearity (INL = 25 LSB MAX.)
- Input Offset Voltage (VOS = 2 mV MAX.)
- Input Offset Voltage Drift vs. Temperature (|dVos/dTA| = 2.5 μV/°C MAX.)
- Output Clock Frequency (fCLK = 10 MHz TYP.)
- High common mode transient immunity (CMR = 15 kV/μs MIN.)
- Long creepage distance (8 mm MIN.)
- Embossed tape product: RV1S9353ACCSP-120x#KC0: 2 000 pcs/reel
- Pb-Free product
- Safety standards
 - UL approved: No. UL1577, Double protection
 - CSA approved: CAN/CSA-C22.2 No.62368-1, Reinforced insulation
 - DIN EN 60747-5-5 approved (Option)

APPLICATIONS

- AC Servo, inverter
- Solar inverter
- Measurement equipment

Isolation Capacitance	C_{I-O}	$f = 1\text{ MHz}$		0.7		pF
Data Hold Time ^{*1}	t_{HDDAT}		10			ns
Common Mode Transient Immunity ^{*2}	CMR	$V_{CM} = 1\text{ kV}$, $T_A = 25^\circ\text{C}$	15	25		$\text{kV}/\mu\text{s}$

*1 The data hold time (t_{HDDAT}) is that the data (MDAT) will stay stable following the rising edge of the clock (MCLK). t_{HDDAT} is shown in the below timing chart.

Fig. Timing Chart

*2 Common Mode Transient Immunity (CMR) is specified by the rate of rise / fall of a pulse applied between GND1 on the input side and GND2 on the output side (pins 4 and 5) by using the circuit shown in Fig. 6 CMR Test Circuit. CMR is defined at the point that clock signals are corrupted.

Internal Reference Voltage Drift vs. Supply Voltage	$ dV_{REF}/dV_{DD1} $			0.2		mV/V
Input DC Common-Mode Rejection Ratio *7	$CMRR_{IN}$			80		dB

*3 Integral non-linearity (INL) is the maximum deviation between the ideal conversion line (best-fit line) and measured points. The best-fit line is obtained by using the least-squares method from the differential input voltage ($V_{IN+} - V_{IN-}$: $V_{IN+} = -200\text{ mV}$ to 200 mV , $V_{IN-} = 0\text{ V}$) and the output data that is measured under the circuit shown in **Fig. 7 INL Test Circuit**. INL is defined as the ratio (%) obtained by dividing [Half of the peak to peak value of the deviation] by [full-scale differential input voltage 400 mV].

For example, if the differential input voltage is $V_{IN+} = -200\text{ mV}$ to 200 mV , and the peak to peak value of the deviation is 0.49 mV, Integral non-linearity is obtained as follows:

$$\text{INL} = 0.49\text{ mV} / (2 \times 400\text{ mV}) = 0.06\%$$

And Input Full-Scale 640 mV (-320 to 320 mV) of RV1S9353A is assigned 16 bits ($2^{16} = 65536$).

Therefore, Least Significant Bit (LSB) is $9.75\ \mu\text{V}$.

By LSB indication, above-mentioned INL is $0.49\text{ mV} / (2 \times 0.00975\text{ mV}) = 25\text{ LSBs}$.

*4 Differential non-linearity (DNL) is the difference between a measured code width and ideal 1 LSB in the ADC transfer curve.

*5 Input offset voltage (V_{OS}) is a measured value after Sinc³ digital filter when the input voltage is 0 V ($V_{IN+} = V_{IN-} = 0\text{ V}$).

*6 Absolute Internal Reference Voltage Tolerance (G_E) is the gap rate between the ideal conversion line slope (Slope = 1) and a best-fit line slope that provided by the least-squares method from a real conversion level output for the differential input voltage ($V_{IN+} - V_{IN-}$: $V_{IN+} = -200\text{ mV}$ to 200 mV , $V_{IN-} = 0\text{ V}$).

*7 Input DC Common-Mode Rejection Ratio ($CMRR_{IN}$) is the ratio of the differential signal ($V_{IN+} = -200\text{ mV}$ to 200 mV , $V_{IN-} = 0\text{ V}$) to the common-mode signal ($V_{IN+} = V_{IN-} = -200\text{ mV}$ to 200 mV : Both input pins are connected). $CMRR_{IN}$ is defined as follows,

$$CMRR_{IN}(\text{dB}) = 20 \log (V_{do}/V_{co})$$

V_{do} : Output voltage when the differential signal voltage input

V_{co} : Output voltage when the common-mode signal voltage input

ELECTRICAL CHARACTERISTICS (Tested with Sinc³ filter, 256 decimation ratio.)

Parameter	Symbol	Conditions	MIN.	TYP.	MAX.	Unit
Signal to Noise Ratio *8	SNR	VIN+ = 35 Hz, 400 mVpk-pk (141 mVr.m.s.) sine wave	80	85		dB
Signal to Noise and Distortion Ratio *9	SNDR		69	79		dB
Effective Number of Bit *10	ENOB			13.8		bits

*8 Signal to Noise Ratio (SNR) is the ratio of the AC signal power to the noise power that excludes harmonic signals and DC. SNR is defined as follows,

$$\text{SNR (dB)} = 10 \log(P_s/P_N)$$

Ps: Signal power (fundamental)

PN: Noise power (excluding harmonic signals and DC)

*9 Signal to Noise and Distortion ratio (SNDR) is the ratio of the AC signal power (fundamental) to the noise power plus distortion power. SNDR is defined as follows,

$$\text{SNDR (dB)} = 10 \log(P_s/(P_N + P_{H2} + P_{H3} + \dots + P_{H5}))$$

Ps: Signal power (fundamental)

PN: Noise power (excluding harmonic signals and DC)

PH2, PH3 ... PH5: Second through fifth harmonics power

*10 Effective Number of Bit (ENOB) is the effective resolution of ADC that is considered the noise. ENOB is defined as follows,

$$\text{ENOB (bits)} = (\text{SNR} - 1.76)/6.02$$

NOTES ON HANDLING

1. Recommended soldering conditions

(1) Infrared reflow soldering

- Peak reflow temperature 260°C or below (package surface temperature)
- Time of peak reflow temperature 10 seconds or less
- Time of temperature higher than 220°C 60 seconds or less
- Time to preheat temperature from 120 to 180°C 120±30 s
- Number of reflows Three
- Flux Rosin flux containing small amount of chlorine (The flux with a maximum chlorine content of 0.2 Wt% is recommended.)

Recommended Temperature Profile of Infrared Reflow

(2) Wave soldering

- Temperature 260°C or below (molten solder temperature)
- Time 10 seconds or less
- Preheating conditions 120°C or below (package surface temperature)
- Number of times One (Allowed to be dipped in solder including plastic mold portion.)
- Flux Rosin flux containing small amount of chlorine (The flux with a maximum chlorine content of 0.2 Wt% is recommended.)

(3) Soldering by Soldering Iron

- Peak Temperature (lead part temperature) 350°C or below
 - Time (each pins) 3 seconds or less
 - Flux Rosin flux containing small amount of chlorine
(The flux with a maximum chlorine content of 0.2 Wt% is recommended.)
- (a) Soldering of leads should be made at the point 1.5 to 2.0 mm from the root of the lead
 (b) Please be sure that the temperature of the package would not be heated over 100°C

(4) Cautions

- Flux Cleaning
Avoid cleaning with Freon based or halogen-based (chlorinated etc.) solvents.
- Do not use fixing agents or coatings containing halogen-based substances.

2. Cautions regarding noise

Be aware that when voltage is applied suddenly between the photocoupler's input and output at startup, the output transistor may enter the on state, even if the voltage is within the absolute maximum ratings.

USAGE CAUTIONS

1. This product is weak for static electricity by designed with high-speed integrated circuit so protect against static electricity when handling.
2. Board designing
 - (1) Below figure shows a typical application circuit where the RV1S9353A is used. A digital filter (Sinc³ filter) reduces high frequency quantization noise from the RV1S9353A and converts from one-bit data stream to 3-wire serial data.

Fig. RV1S9353A Typical application circuit

- (2) By-pass capacitor of more than 0.1 μF is used between V_{DD} and GND near device. Also, ensure that the distance between the leads of the photocoupler and capacitor is no more than 10 mm.
 - (3) Keep the pattern connected the input ($V_{\text{IN}+}$, $V_{\text{IN}-}$) and the output (MCLK, MDAT), respectively, as short as possible. MCLK and MDAT are digital signal, but when the lines between the photocoupler and a digital filter are long, the digital filter might not read the data.
When using long lines, use a line driver between the photocoupler and the digital filter, and keep the pattern between the output (MCLK, MDAT) and the line driver as short as possible.
 - (4) Do not connect any routing to the portion of the frame exposed between the pins on the package of the photocoupler. If connected, it will affect the photocoupler's internal voltage and the photocoupler will not operate normally.
 - (5) Because the maximum frequency of the signal input to the photocoupler must be lower than the allowable frequency band, be sure to connect an anti-aliasing filter (an RC filter with $R = 39 \Omega$ and $C = 0.01 \mu\text{F}$, for example).
 - (6) When $V_{\text{DD}1}$ is lower than 4.5 V that is the outside of the recommended operating condition, the output (MCLK, MDAT) of this product is unstable, and this might produce undesirable operation. Be sure to check the operation of an IC that is connected to this product during Power-up and Power-down process. And we recommend to use a disable function (shutdown function) of the connected IC or a reset IC to avoid this undesirable operation.
3. Avoid storage at a high temperature and high humidity.
