LMV321 / LMV358 / LMV324 General-Purpose, Low Voltage, Rail-to-Rail Output Amplifiers

Features at +2.7V

- 80 μ A Supply Current per Channel
- 1.2 MHz Gain Bandwidth Product
- Output Voltage Range: 0.01 V to 2.69 V
- Input Voltage Range: -0.25 V to +1.5 V
- 1.5 V/ μ s Slew Rate
- LMV321 Directly Replaces Other Industry Standard LMV321 Amplifiers: Available in SC70-5 and SOT23-5 Packages
- LMV358 Directly Replaces Other Industry Standard LMV358 Amplifiers: Available in MSOP-8 and SOIC-8 Packages
- LMV324 Directly Replaces Other Industry Standard LMV324 Amplifiers: Available in SOIC-14 Packages
- Fully Specified at +2.7 V and +5 V Supplies
- Operating Temperature Range: -40°C to +125°C

Applications

- Low Cost General-Purpose Applications
- Cellular Phones
- Personal Data Assistants
- A/D Buffer
- DSP Interface
- Smart Card Readers
- Portable Test Instruments
- Keyless Entry
- Infrared Receivers for Remote Controls
- Telephone Systems
- Audio Applications
- Digital Still Cameras
- Hard Disk Drives
- MP3 Players

Description

The LMV321 (single), LMV358 (dual), and LMV324 (quad) are a low cost, voltage feedback amplifiers that consume only 80 μ A of supply current per amplifier. The LMV3XX family is designed to operate from 2.7 V (\pm 1.35 V) to 5.5 V (\pm 2.75 V) supplies. The common mode voltage range extends below the negative rail and the output provides rail-to-rail performance.

The LMV3XX family is designed on a CMOS process and provides 1.2 MHz of bandwidth and 1.5 V/ μ s of slew rate at a low supply voltage of 2.7 V. The combination of low power, rail-to-rail performance, low voltage operation, and tiny pack-age options make the LMV3XX family well suited for use in personal electronics equipment such as cellular handsets, pagers, PDAs, and other battery powered applications.

Absolute Maximum Ratings

Stresses exceeding the absolute maximum ratings may damage the device. The device may not function or be operable above the recommended operating conditions and stressing the parts to these levels is not recommended. In addition, extended exposure to stresses above the recommended operating conditions may affect device reliability. The absolute maximum ratings are stress ratings only.

Application Information

General Description

The LMV3XX family are single supply, general-purpose, voltage-feedback amplifiers that are pin-for-pin compatible and drop in replacements with other industry standard LMV321, LMV358, and LMV324 amplifiers. The LMV3XX family is fabricated on a CMOS process, features a rail-to-rail output, and is unity gain stable.

The typical non-inverting circuit schematic is shown in Figure 1.

Figure 1. Typical Non-inverting configuration

Power Dissipation

The maximum internal power dissipation allowed is directly related to the maximum junction temperature. If the maximum junction temperature exceeds 150°C, some performance degradation will occur. If the maximum junction temperature exceeds 175°C for an extended time, device failure may occur.

Driving Capacitive Loads

The **Frequency Response vs. C_L** plot on page 4, illustrates the response of the LMV3XX family. A small series resistance (R_S) at the output of the amplifier, illustrated in Figure 2, will improve stability and settling performance. R_S values in the **Frequency Response vs. C_L** plot were chosen to achieve maximum bandwidth with less than 1dB of peaking. For maximum flatness, use a larger R_S . As the plot indicates, the LMV3XX family can easily drive a 200 pF capacitive load without a series resistance. For comparison, the plot also shows the LMV321 driving a 200 pF load with a 225 Ω series resistance.

Driving a capacitive load introduces phase-lag into the output signal, which reduces phase margin in the amplifier. The unity gain follower is the most sensitive configuration. In a unity gain follower configuration, the LMV3XX family requires a 450 Ω series resistor to drive a 200 pF load. The response is illustrated in Figure 3.

Layout Considerations

General layout and supply bypassing play major roles in high frequency performance. ON Semiconductor has evaluation boards to use as a guide for high frequency layout and as aid in device testing and characterization. Follow the steps below as a basis for high frequency layout:

- Include 6.8 μF and 0.01 μF ceramic capacitors
- Place the 6.8 μF capacitor within 0.75 inches of the power pin
- Place the 0.01 μF capacitor within 0.1 inches of the power pin
- Remove the ground plane under and around the part, especially near the input and output pins to reduce parasitic capacitance
- Minimize all trace lengths to reduce series inductances

Refer to the evaluation board layouts shown in Figure 5 on page 8 for more information.

Evaluation Board Information

The following evaluation boards are NOT available any more but their Schematic & Layout information will be useful for references to aid in the testing and layout of this device.
