4. Product Description

The Swissbit® N-26m2 Solid State Drive (SSD) leverages the M.2 standard and NVMe standard to support a PCIe electrical interface as well as AES encryption, E2E data protection and TCG Opal standards. The NVMe controller and the newest 3D NAND flash technology provides robust, non-volatile storage solution for today's embedded computing applications. A functional block diagram of the N-26m2 SSD is provided below in Figure 1.

Figure 1: N-26m2 Functional Block Diagram

The N-26m2 SSD incorporates a 75-position edge connector with M key to support host read/write, control, and power activity per the applicable JEDEC specification.

The on-board NVMe controller manages the interface between the host and the non-volatile NAND flash memory array. The controller is designed to support PCIe interface speeds and utilizes a dual processing core, providing an optimum balance between read/write performance, Data Care Management, and power fail protection.

Swissbit's N-26m2 SSDs deliver an impressive IOPS rate and highest endurance by combining Bit Cost Scalable (BiCS) 3D flash technology with a high-end controller architecture, firmware, and an optimized configuration. The SSDs are designed for applications requiring high data transfer rates (see Table 3: Read/Write Performance). This performance is achieved through HMB support, a 4-channel flash controller and 4-lane PCIe interface.

An on-controller Error Correction Code (ECC) engine provides the N-26m2 hardware ECC, which is capable of correcting up to 120 bits per 1 KByte page. This engine, combined with Swissbit's Data Care Management firmware, provides both passive and active data management strategies to ensure data integrity and extract the maximum possible endurance and reliability from the NAND flash array. These strategies include, but are not limited to, Global Wear Leveling, Adaptive Read Refresh, and Dynamic Block Remapping.

4.6 Reliability and Endurance

The Mean Time Between Failure (MTBF) is specified to exceed the value listed in the following Table 10. Data reliability with effective error tolerance and data retention at the beginning and end of life is also provided.

Table 10: Reliability

| Parameter | Value |
|---|--|
| MTBF (at 25 °C) | > 2,000,000 hours |
| Data Reliability | < 1 Non-Recoverable Error per 10 ¹⁶ Bits Read |
| Data Retention (up to 40°C) ¹⁰ | 10 Years at Start (JESD47), 1 Year at EOL |

⁹ The retention at high temperature is reduced. The acceleration factor at 100°C compared with 40 or 55°C is very high, i.e. the initial retention from 10 years@55°C is reduced to 33 days@100°C based on NAND process node.

¹⁰ NAND Flash data retention and endurance characteristics are defined according to JEDEC JESD47 and JESD22. The endurance limits of the storage shall be monitored by the life time information and simulated before field usage by the customer.

Endurance represented as both TeraBytes Written (TBW) and full Drive Writes Per Day (DWPD) for different application scenarios is provided in the following Table 11.

Table 11: Endurance^{11, 12}

Table 12: Drive Geometry

| Raw Capacity | User Capacity ¹⁶ | Total LBA | User Addressable Bytes |
|--------------|-----------------------------|-------------|------------------------|
| | | Decimal | (Unformatted) |
| 16 GBytes | 5 GBytes | 9,788,688 | 5,011,808,256 |

| 512 GBytes | 160 GBytes | 312,581,808 | 160,041,885,696 |

¹¹ Client and Enterprise workloads follow the JEDEC JESD219 standard. Enterprise workload values are measured based on 168 hours of runtime. 1 TByte = 10¹² bytes

¹² According to JEDEC (JESD471), the time to write the full TBW is a minimum of 18 months. Higher average daily data volume or frequent writing below 0°C reduces the specified TBW. The values listed are estimates and are subject to change without notice

¹³ Because the JEDEC master trace file for the Client workload is designed for capacities ≥ 60 GBytes, the TBW and DWPD values for the capacities below 60 GBytes are estimates

¹⁴ DWPD values are based on a service life of 3 years. DWPD values with consideration of the limited lifetime warranty period of the storage device according to the used flash type and device capacity. Customer workload with higher DWPD values contributes to an earlier EOL of the storage device.

¹⁵ Target values

¹⁶ 1 GByte = 10⁹ bytes
