

### GENERAL DESCRIPTION

The SPX1117 is a low power positive-voltage regulator designed to satisfy moderate power requirements with a cost effective, small footprint solution.

This device is an excellent choice for use in battery-powered applications and portable computers. The SPX1117 features very low quiescent current and a low dropout voltage of 1.1V at a full load. As output current decreases, quiescent current flows into the load, increasing efficiency. SPX1117 is available in adjustable or fixed 1.5V, 1.8V, 2.5V, 3.3V and 5V output voltages.

The SPX1117 is offered in a 3-pin SOT-223 surface mount packages.

An output capacitor of 10 $\mu$ F provides unconditional stability while a smaller 2.2 $\mu$ F capacitor is sufficient for most applications.

### APPLICATIONS

- Desktop PC Servers
- Graphic/Video Cards
- Industrial Equipments
- Power Supplies

### FEATURES

- Guaranteed 800mA Output Current
- Guaranteed 1A Peak Current
- Three Terminal Adjustable or Fixed 1.5V, 1.8V, 2.5V, 3.3V and 5V
- Low Quiescent Current
- Low Dropout Voltage of 1.1V at 800mA
- 0.1% Line and 0.2% Load Regulation
- Stable with 2.2 $\mu$ F Ceramic Capacitor
- Overcurrent and Thermal Protection
- Lead Free, RoHS Compliant SOT223 Package

### FUNCTIONAL DIAGRAM

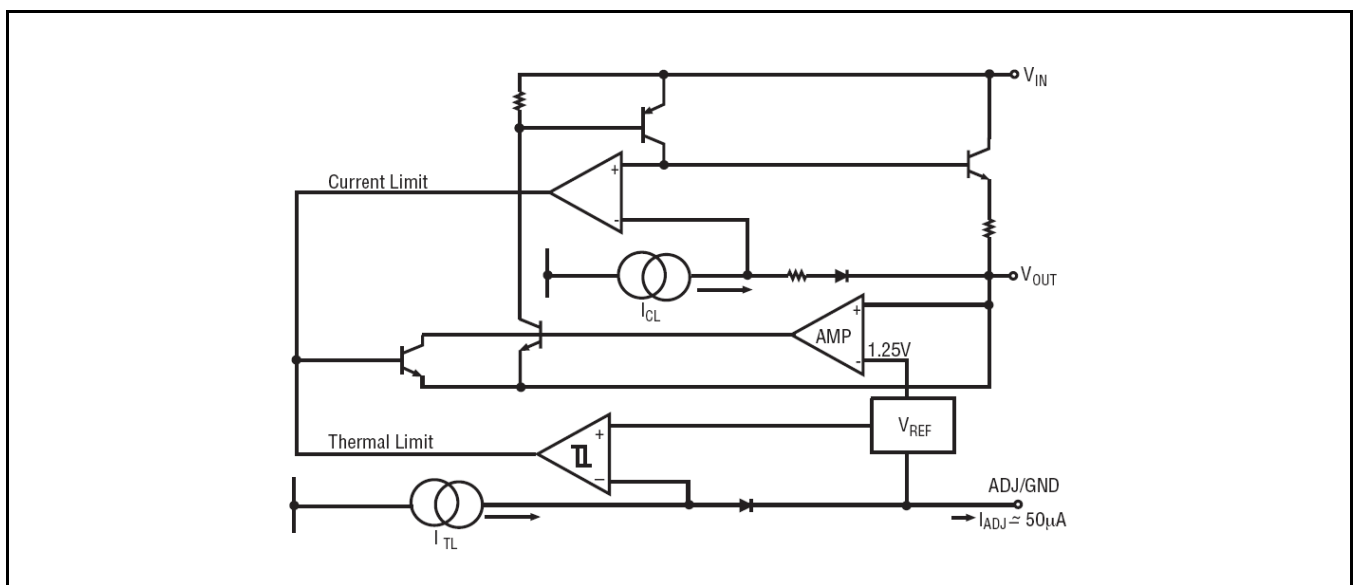

Fig. 1: SPX1117 Application Diagram

### ABSOLUTE MAXIMUM RATINGS

These are stress ratings only and functional operation of the device at these ratings or any other above those indicated in the operation sections of the specifications below is not implied. Exposure to absolute maximum rating conditions for extended periods of time may affect reliability.

Power Dissipation ..... Internally Limited  
 Lead Temperature (Soldering, 5 sec) ..... 260°C  
 Storage Temperature ..... -65°C to 150°C  
 Operating Junction Temperature Range... -40°C to +125°C  
 Input Supply Voltage ..... 20V  
 Input to Output Voltage ..... 18.8V  
 ESD Rating (HBM - Human Body Model) ..... 2kV

### ELECTRICAL SPECIFICATIONS

Specifications with standard type are for an Operating Ambient Temperature of  $T_A = 25^\circ\text{C}$  only; limits applying over the full Operating Junction Temperature range are denoted by a “•”. Minimum and Maximum limits are guaranteed through test, design, or statistical correlation. Typical values represent the most likely parametric norm at  $T_J = 25^\circ\text{C}$ , and are provided for reference purposes only. Unless otherwise indicated,  $C_{IN} = C_{OUT} = 10\mu\text{F}$ ,  $T_A = 25^\circ\text{C}$ .

Parameter	Min.	Typ.	Max.	Units	Conditions
<b>1.5V Version</b>					
Output Voltage	1.485	1.500	1.515	V	$I_{OUT}=5\text{mA}$ , $V_{IN}=3.0\text{V}$ , $T_J=25^\circ\text{C}$
	1.470		1.530		• $5\text{mA} \leq I_{OUT} \leq 800\text{mA}$ , $2.9\text{V} \leq V_{IN} \leq 10\text{V}$
<b>1.8V Version</b>					
Output Voltage	1.782	1.800	1.818	V	$I_{OUT}=5\text{mA}$ , $V_{IN}=3.3\text{V}$ , $T_J=25^\circ\text{C}$
	1.764		1.836		• $5\text{mA} \leq I_{OUT} \leq 800\text{mA}$ , $3.2\text{V} \leq V_{IN} \leq 10\text{V}$
<b>2.5V Version</b>					
Output Voltage	2.475	2.500	2.525	V	$I_{OUT}=5\text{mA}$ , $V_{IN}=4.0\text{V}$ , $T_J=25^\circ\text{C}$
	2.450		2.550		• $5\text{mA} \leq I_{OUT} \leq 800\text{mA}$ , $3.9\text{V} \leq V_{IN} \leq 10\text{V}$
<b>3.3V Version</b>					
Output Voltage	3.267	3.300	3.333	V	$I_{OUT}=5\text{mA}$ , $V_{IN}=4.8\text{V}$ , $T_J=25^\circ\text{C}$
	3.234		3.366		•
<b>5.0V Version</b>					
Output Voltage	4.950	5.000	5.050	V	$I_{OUT}=5\text{mA}$ , $V_{IN}=6.5\text{V}$ , $T_J=25^\circ\text{C}$
	4.900		5.100		• $5\text{mA} \leq I_{OUT} \leq 800\text{mA}$ , $6.4\text{V} \leq V_{IN} \leq 12\text{V}$
<b>All Voltage Options</b>					
Reference Voltage	1.238	1.250	1.262	V	$I_{OUT}=5\text{mA}$ , $(V_{IN} - V_{OUT})=2\text{V}$ , $T_J=25^\circ\text{C}$
	1.225		1.270		• $5\text{mA} \leq I_{OUT} \leq 800\text{mA}$ , $1.4\text{V} \leq (V_{IN}-V_{OUT}) \leq 10\text{V}$
Output Voltage Temperature Stability		0.3		%	
Line Regulation (note 1)		3	7	mV	$V_{IN\text{MIN}} \leq V_{IN} \leq 12\text{V}$ , $V_{OUT} = \text{Fixed/Adj.}$ , $I_{OUT}=5\text{mA}$
Load Regulation (note 1)		6	12	mV	• $5\text{mA} \leq I_{OUT} \leq 800\text{mA}$ , $V_{OUT} = \text{Fixed/Adj.}$
Dropout Voltage (note 2)		1.00	1.20	V	• $I_{OUT}=100\text{mA}$
		1.05	1.25		• $I_{OUT}=500\text{mA}$
		1.10	1.30		• $I_{OUT}=800\text{mA}$
Quiescent Current		5	10	mA	• $4.25\text{V} \leq V_{IN} \leq 6.5\text{V}$
Adjust Pin Current		50	120	$\mu\text{A}$	•
Current Limit	1.0	1.5	2.0	A	$(V_{IN} - V_{OUT})=5\text{V}$
Thermal Regulation		0.01	0.1	%/W	$25^\circ\text{C}$ , 30ms pulse
Ripple Rejection	60	75		dB	$f_{\text{RIPPLE}}=120\text{Hz}$ , $(V_{IN} - V_{OUT})=2\text{V}$ , $V_{\text{RIPPLE}}=1\text{V}_{\text{PP}}$

**800mA Low Dropout Voltage Regulator**

Parameter	Min.	Typ.	Max.	Units	Conditions
Long Term Stability		0.03		%	125°C, 1000Hrs
RMS Output Noise		0.003		%	% of $V_{OUT}$ , $10\text{Hz} \leq f \leq 10\text{kHz}$

Note 1:

For fixed voltage option  $V_{INMIN} = V_{OUT} + 1.5\text{V}$

For adjustable voltage option  $V_{IN} - V_{OUT} = 1.4\text{V}$

Note 2: Dropout voltage is the input voltage minus output voltage that produces a 1% decrease in output voltage with respect to the nominal output voltage at  $V_{IN} = V_{OUT} + 1.5\text{V}$

**APPLICATION INFORMATION**

**OUTPUT CAPACITOR**

To ensure the stability of the SPX1117, an output capacitor of at least 2.2 $\mu$ F (tantalum or ceramic) or 10 $\mu$ F (aluminum) is required. The value may change based on the application requirements of the output load or temperature range. The value of ESR can vary based on the type of capacitor used in the applications to guarantee stability. The recommended value for ESR is 0.5 $\Omega$  or less. A larger value of output capacitance (up to 100 $\mu$ F) can improve the load transient response.

**SOLDERING METHODS**

The SPX1117 SOT-223 package is designed to be compatible with infrared reflow or vapor-phase reflow soldering techniques. During soldering, the non-active or mildly active fluxes may be used. The SPX1117 die is attached to the heatsink lead which exits opposite the input, output, and ground pins.

Hand soldering and wave soldering should be avoided since these methods can cause damage to the device with excessive thermal gradients on the package. The SOT-223 recommended soldering method are as follows: vapor phase reflow and infrared reflow with the component preheated to within 65°C of the soldering temperature range.

**THERMAL CHARACTERISTICS**

The thermal resistance of SPX1117 (SOT-223 package) is 15°C/W from junction to tab and 31°C/W from tab to ambient for a total of 46°C/W from junction to ambient (Table 1). The SPX1117 features the internal thermal limiting to protect the device during overload conditions. Special care needs to be taken during continuous load conditions such that the maximum junction temperature does not exceed 125°C. Thermal protection is activated at >155°C and deactivated at <140°C.

Taking the FR-4 printed circuit board and 1/16 thick with 1 ounce copper foil as an experiment (fig.19), the PCB material is effective at transmitting heat with the tab

**800mA Low Dropout Voltage Regulator**

attached to the pad area and a ground plane layer on the backside of the substrate. Refer to table 1 for the results of the experiment.

The thermal interaction from other components in the application can affect the thermal resistance of the SPX1117. The actual thermal resistance can be determined with experimentation.

SPX1117 power dissipation is calculated as follows:

$$P_D = (V_{IN} - V_{OUT}) \times I_{OUT}$$

Maximum Junction Temperature

$$T_J = T_{A(MAX)} + P_D \times \text{thermal resistance (Jct to amb.)}$$

Maximum junction temperature must not exceed 125°C.

Fig. 19: Substrate Layout for SOT-223

**RIPPLE REJECTION**

Ripple rejection can be improved by adding a capacitor between the ADJ pin and ground as shown in Figure 23. When ADJ pin bypassing is used, the value of the output capacitor required increases to its maximum. If the ADJ pin is not bypassed, the value of the output capacitor can be lowered to 10µF for an electrolytic aluminum capacitor or 2.2µF for a ceramic or solid tantalum capacitor (Fig 22).

However the value of the ADJ-bypass capacitor should be chosen with respect to the following equation:

$$C = \frac{1}{6.28 \times F_R \times R_1}$$

Where

C: value of capacitor in Farads

F<sub>R</sub>: ripple frequency in Hz

R1: value of resistor R1 in ohms

If an ADJ-bypass capacitor is used, the amplitude of the output ripple will be independent of the output voltage. If an ADJ-bypass capacitor is not used, the output ripple will be proportional to the ratio of the output voltage to the reference voltage:

$$M = \frac{V_{OUT}}{V_{REF}}$$

Where M=multiplier for the ripple seen when the ADJ pin is optimally bypassed.

$$V_{REF} = 1.25V$$

Ripple rejection for the adjustable version is shown in Figure 20.

Fig. 20: Ripple Rejection  
V<sub>IN</sub>=3.3V, V<sub>OUT</sub>=1.8V(adj), I<sub>LOAD</sub>=200mA

**OUTPUT VOLTAGE**

The output of the adjustable regulator can be set to any voltage between 1.25V and 15V. The value of V<sub>OUT</sub> can be quickly approximated using the formula

$$V_{OUT} = 1.25 \times \frac{R_1 + R_2}{R_1}$$

A small correction to this formula is required depending on the values of resistors R1 and R2, since the adjustable pin current (approx 50µA) flows through R2. When I<sub>ADJ</sub> is taken into account, the formula becomes

$$V_{OUT} = V_{REF} \times \frac{R_1 + R_2}{R_1} + I_{ADJ} \times R_2$$

Where  $V_{REF}=1.25V$

**PRE-BIAS OUTPUT VOLTAGE START-UP**

The SPX1117 is not intended for operations requiring start-up into a pre-biased load. Proper discharge of the output voltage is recommended prior of turning on the device through the application of the input voltage.

**LAYOUT CONSIDERATIONS**

Parasitic line resistance can degrade local regulation. In order to avoid this, connect  $R_1$  directly to  $V_{OUT}$  as illustrated in figure 25. For the same reason  $R_2$  should be connected to the negative side of the load.
