

### Description

The [SPX2954](#) and [SPX2954A](#) are low power voltage regulators. These devices are an excellent choice for use in battery-powered applications such as cordless telephones, radio control systems, and portable computers. The SPX2954 and SPX2954A feature low quiescent current and low dropout voltage (typ. 20mV at 100µA and 310mV at 250mA). This includes a tight initial tolerance (0.5% for SPX2954A), extremely good load and line regulation (0.05% typ.), and very low output temperature coefficient (20 ppm/°C typ.), making the SPX2954/SPX2954A useful as a low-power voltage reference.

The error flag output feature is used as a power-on reset for warning of a low output voltage, due to a falling input voltage. The logic-compatible shutdown feature enables the regulator to be switched ON and OFF. The SPX2954/SPX2954A is offered in a 3-pin SOT-223 package and an 8-pin SOIC package.

### FEATURES

- 5.0V and 3.3V versions at 250mA output
- Accurate 0.5% for SPX2954A
- Very low quiescent current
- Low dropout: 310mV at 250mA
- Extremely tight load and line regulation
- Very low temperature coefficient
- Current and thermal limiting
- Need only 1µF for stability
- Direct replacement for LP2954
- Error flag warns of output dropout
- Logic-controlled electronic shutdown
- Programmable output from 1.24V to 30V

### Typical Application

Typical Application

### Absolute Maximum Ratings

Stresses beyond the limits listed below may cause permanent damage to the device. Exposure to any Absolute Maximum Rating condition for extended periods may affect device reliability and lifetime.

Power Dissipation..... Internally Limited  
Lead Temperature (soldering, 5 seconds)..... 260°C  
Storage Temperature ..... -65°C to 150°C  
Operating Junction Temperature Range ..... -40°C to 125°C  
Input Supply Voltage ..... -0.3V to 30V

Feedback Input Voltage..... -1.5V to 30V  
Shutdown Input Voltage ..... -0.3V to 30V  
Error Comparator Voltage ..... -0.3V to 30V  
ESD Rating..... 2kV Min

## Electrical Characteristics

Unless otherwise noted:  $V_{IN} = V_O + 1V$ ,  $I_L = 100\mu A$ ,  $C_L = 1\mu F^{(2)}$   $T_A = 25^\circ C$ .

**NOTES:**

1. Output or reference voltage temperature coefficients defined as the worst case voltage change divided by the total temperature range.
2. Unless otherwise specified all limits guaranteed for  $T_J = 25^{\circ}C$ ,  $V_{IN} = 6V$ ,  $I_L = 100\mu A$  and  $C_L = 1\mu F$ . Additional conditions for the 8-pin versions are feedback tied to 5V tap and output tied to output sense ( $V_{OUT} = 5V$ ) and  $V_{SHUTDOWN} \leq 0.8V$ .
3. Regulation is measured at constant junction temperature, using pulse testing with a low duty cycle. Changes in output voltage due to heating effects are covered under the specification for thermal regulation.
4. Line regulation for the SPX2954 is tested at  $I_L = 1mA$ .
5. Dropout voltage is defined as the input to output differential at which the output voltage drops 100mV below its nominal value measured at 1V differential. At very low values of programmed output voltage, the minimum input supply voltage of 2V (2.3V over temperature) must be taken into account.
6.  $V_{REF} \leq V_{OUT} \leq (V_{IN} - 1V)$ ,  $2.3 \leq V_{IN} \leq 30V$ ,  $100\mu A \leq I_L \leq 250mA$ ,  $T_J \leq T_{JMAX}$ .
7. Comparator thresholds are expressed in terms of a voltage differential at the feedback terminal below the nominal reference voltage measured at 6V input. To express these thresholds in terms of output voltage change, multiply by the error amplifier gain =  $V_{OUT}/V_{REF} = (R1 + R2)/R2$ . For example, at a programmed output voltage of 5V, the error output is guaranteed to go low when the output drops by  $95mV \times 5V/1.235 = 384mV$ . Thresholds remain constant as a percent of  $V_{OUT}$  as  $V_{OUT}$  is varied, with the dropout warning occurring at typically 5% below nominal, 7.5% guaranteed.
8.  $V_{SHUTDOWN} \geq 2V$ ,  $V_{IN} \leq 30V$ ,  $V_{OUT} = 0$ , Feedback pin tied to 5V/3.3V Tap.

## Applications Information

### External Capacitors

The stability of the SPX2954 requires a 1 $\mu$ F or greater capacitor between output and ground. Oscillation could occur without this capacitor. Most types of tantalum or aluminum electrolytic works fine here. For operations below -25°C solid tantalum is recommended since the many aluminum types have electrolytes that freeze at about -30°C. The ESR of about 5 $\Omega$  or less and resonant frequency above 500kHz are the most important parameters in the value of the capacitor. The capacitors value may be increased without limit.

At lower values of output current, less output capacitance is required for stability. For the currents below 10mA the value of the capacitor can be reduced to 0.33 $\mu$ F and 0.1 $\mu$ F for 1mA. More output capacitance is needed for the 8-pin version at voltages below 5V since it runs the error amplifier at lower gain. At worst case 3.3 $\mu$ F or greater must be used for the condition of 150mA load at 1.23V output.

The SPX2954 unlike other low dropout regulators will remain stable and in regulation with no load in addition to the internal voltage divider. This feature is especially important in applications like CMOS RAM keep-alive. When setting the output voltage of the SPX2954 version with external resistors, a minimum load of 1 $\mu$ A is recommended.

If there is more than 10 inches of wire between the input and the AC filter capacitor or if a battery is used as the input then a 1 $\mu$ F tantalum or aluminum electrolytic capacitor should be placed from the input to the ground.

Instability can occur if there is stray capacitance to the SPX2954 feedback terminal (pin 7). This could cause more problems when using a higher value of external resistors to set the output voltage. This problem can be fixed by adding a 100pF capacitor between output and feedback and increasing the output capacitor to at least 3.3 $\mu$ F.

### Error Detection Comparator Output

The comparator produces a logic low output whenever the SPX2954 output falls out of regulation by more than around 5%. This is around 60mV offset divided by the 1.235 reference voltage. This trip level remains 5% below normal regardless of the programmed output voltage of the regulator.

Figure 1 shows the timing diagram depicting the ERROR signal and the regulator output voltage as the SPX2954 input is ramped up and down. The ERROR signal becomes low at around 1.3V input, and goes high around 5V input (input voltage at which  $V_{OUT} = 4.75$ ). Since the SPX2954's dropout voltage is load dependent, the input voltage trip point (around 5V) will vary with the load current. The output voltage trip point (approx. 4.75V) does not vary with load.

The error comparator has an open-collector output, which requires an external pull-up resistor. Depending on the system requirements the resistor may be returned to 5V output or other supply voltage. In determining the value of this resistor, note that the output is rated to sink 400mA, this value adds to battery drain in a low battery condition. Suggested values range from 100k to 1M $\Omega$ . If the output is unused this resistor is not required.

### Programming the Output Voltage of SPX2954

The SPX2954 may be pin-strapped for 5V using its internal voltage divider by tying Pin 1 (output) to Pin 2 (sense) and Pin 7 (feedback) to Pin 6 (5V Tap). Also, it may be programmed for any output voltage between its 1.235V reference and its 30V maximum rating using an external pair of resistors. Refer to the below equation for the programming of the output voltage:

$$V_{OUT} = V_{REF} \times (1 + R_1/R_2) + I_{FB} R_1$$

The  $V_{REF}$  is 1.235 and  $I_{FB}$  is the feedback bias current, nominally -20nA. The minimum recommended load current of 1 $\mu$ A forces an upper limit of 1.2M $\Omega$  on value of  $R_2$ . If no load is presented the  $I_{FB}$  produces an error of typically 2% in  $V_{OUT}$  which may be eliminated at room temperature by trimming  $R_1$ . To improve the accuracy choose the value of  $R_2 = 100k$  this reduces the error by 0.17% and increases the resistor program current by 12 $\mu$ A. Since the SPX2954 typically draws 60 $\mu$ A at no load with Pin 2 open-circuited, this is a small price to pay.

**Reducing Output Noise**

It may be an advantage to reduce the AC noise present at the output. One way is to reduce the regulator bandwidth by increasing the size of the output capacitor. This is the only way that noise can be reduced on the 3 lead SPX2954 but is relatively inefficient, as increasing the capacitor from 1μF to 220μF only decreases the noise from 430μV to 160μVRMS for a 100kHz bandwidth at 5V output. Noise can be reduced fourfold by using a bypass capacitor across R<sub>1</sub>, since it reduces the high frequency gain from 4 to unity. Pick

$$C_{\text{BYPASS}} \approx (1 / 2\pi R_1 \times 200\text{Hz})$$

or choose 0.01μF. When doing this, the output capacitor must be increased to 3.3μF to maintain stability. These changes reduce the output noise from 430μV to 100μVRMS for a 100kHz bandwidth at 5V output. With the bypass capacitor added, noise no longer scales with output voltage so that improvements are more dramatic at higher output voltages.
