

Digital controller for power conversion applications with up to 6 programmable PWM generators, 96 MHz PLL

Datasheet - production data

Features

- Up to 6 programmable PWM generators (SMED - “State Machine Event Driven”)
 - 10 ns event detection and reaction
 - Max.1.3 ns PWM resolution
 - Single, coupled and two coupled operational modes
 - Up to 3 internal/external events per SMED
- 4 analog comparators
 - 4 internal 4-bit references
 - Up to 4 external references
 - Less than 50 ns propagation time
 - Continuous comparison cycle
 - Configurable hysteresis voltage levels
- ADCs (up to 8 channels)
 - 10-bit precision, with operational amplifier to extend resolution to 12-bit equivalent
 - Sequencer functionality
 - Input impedance: 1 MΩ
 - Configurable gain value: x1 and x4
- Integrated microcontroller
 - Advanced STM8[®] core with Harvard architecture and 3-stage pipeline
 - Max. f_{CPU}: 16 MHz
- Memories
 - Flash and E²PROM with read while write (RWW) and error correction code (ECC)
 - Program memory: 32 Kbytes Flash; data retention 15 years at 85 °C after 10 kcycles at 25 °C
 - Data memory: 1 Kbyte true data E²PROM; data retention:15 years at 85 °C after 100 kcycles at 85 °C
 - RAM: 6 Kbytes
- Clock management
 - Internal 96 MHz PLL
 - Low power oscillator circuit for external crystal resonator or direct clock input
 - Internal, user-trimmable 16 MHz RC and low power 153.6 kHz RC oscillators
 - Clock security system with clock monitor
- Basic peripherals
 - System, auxiliary and basic timers
 - IWDG/WWDG watchdog, AWU, ITC
- Reset and supply management
 - Multiple low power modes (wait, slow, auto-wakeup, Halt) with user definable clock gating
 - Low consumption power-on and power-down reset
- I/O
 - Multifunction bidirectional GPIO with highly robust design, immune against current injection
 - Fast digital input DIGIN, with configurable pull-up
- Communication interfaces
 - UART asynchronous with SW flow control and bootloader support
 - I²C master/slave fast-slow speed rate
- Operating temperature: -40 °C up to 105 °C.

1 Description

STNRG devices are a part of the STNRG family of STMicroelectronics® digital devices designed for advanced power conversion applications.

The STNRG improves the design of the successful STLUX™ family, now integrated in a wide range of LED driver architectures, to support industrial power conversion applications such as PFC+LLC, interleaved LC DC/DC, interleaved PFC for smart power supplies as well as the full bridge for pilot line drivers for electric vehicles.

2 STNRG family features list

All devices of the STNRG family provide the following features:

Table 2. STNR388A features list

| Feature list | | Device |
|--------------------------------|-----------------------------|------------------|
| | | STNRG388A |
| Package | | TSSOP38 |
| Pin count | | 38 |
| SMED numbers | | 6 |
| SMED PWM output pins | | 6 |
| Fast digital inputs pins | | 6 |
| Positive comparator input pin | | 4 |
| Negative comparator input pins | | 3 ⁽¹⁾ |
| Comparator hysteresis | | Yes |
| Internal DACs | | 4 |
| ADC input pins | | 8 |
| ADC gain | | x1 - x4 |
| ADC hardware trigger | | Yes |
| GPIO Port 0 pins | | 6 |
| Communication | UART peripheral | Yes |
| | I ² C peripheral | Yes |
| | DALI peripheral | Yes |
| HSE function | | Yes |
| Timers | System timer | 1 |
| | Auxiliary timer | 1 |
| | Basic timer | 2 |
| Auto-wakeup timer | | 1 |
| Watchdog | Window watchdog timer | 1 |
| | Independent watchdog timer | 1 |
| Flash program memory | | 32 Kbytes |
| EEPROM data memory | | 1 Kbytes |
| RAM | | 6 Kbytes |
| SWIM pin | | Mixed |

1. Some CPM pin is shared with other signals.

3 Introducing SMED

The heart of the STNRG controller family is the SMED (state machine event driven) technology which allows the device to pilot six independently configurable PWM clocks with a maximum resolution of 1.3 ns. A SMED is a powerful autonomous state machine, which is programmed to react to both external and internal events and may evolve without any software intervention. The SMED reaction time can be as low as 10.4 ns, giving the STNRG the ability of operating in time critical applications. The SMEDs offer superior performances when compared to traditional, timer based, PWM generators.

Each SMED is configured via the STNRG internal microcontroller. The integrated controller extends the STNRG reliability and guarantees more than 15 years of both operating lifetime and memory data retention for program and data memory after cycling.

A set of dedicated peripherals complete the STNRG device:

- 4 analog comparators with configurable references and 50 ns max. propagation delay. It is ideal to implement zero current detection algorithms or detect current peaks.
- 10-bit ADC with configurable op amp and 8-channel sequencer.
- 96 MHz PLL for high output signal resolution.

Documentation

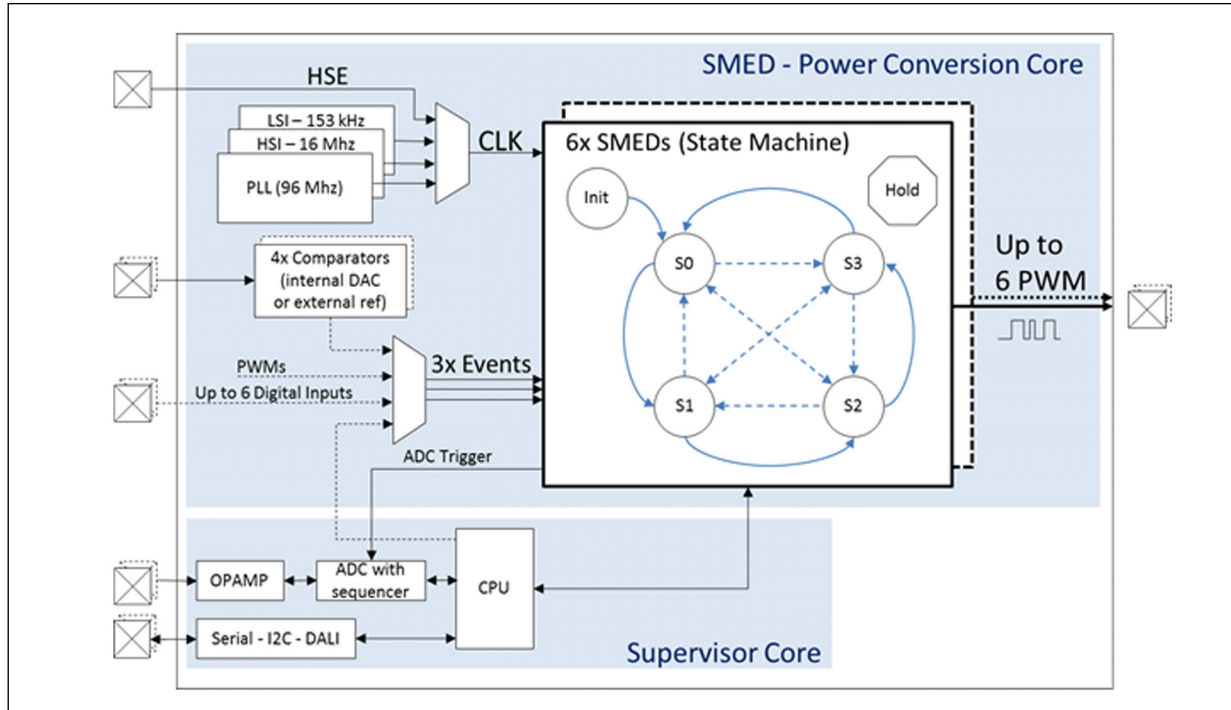

This datasheet contains the description of features, pinout, pin assignment, electrical characteristics, mechanical data and ordering information.

- For information on programming, erasing and protection of the internal Flash memory, please refer to the STM8S reference in the programming manual “How to program STM8S and STM8A Flash program memory and data EEPROM” (PM0051).
- For information on the debug and SWIM (single wire interface module) interface refer to the “STM8 SWIM communication protocol and debug module” user manual (UM0470).
- For information on the STM8 core, please refer to the “STM8 CPU programming manual” (PM0044).

4 System architecture

The STNRG device generates and controls PWM signals by means of a state machine, called SMED (state machine event driven). *Figure 1* gives an overview of the internal architecture.

Figure 1. STNRG internal design

The core of the device is the SMED unit: a hardware state machine driven by system events. The SMED includes 4 states (S0, S1, S2 and S3) available during running operations. A special HOLD state is provided as well. The SMED allows the user to configure, for every state, which system events will trigger a transaction to a new state. During a transaction from one state to the other, the PWM output signal level can be updated.

Once a SMED is configured and running, it becomes an autonomous unit, so no interaction is required since the SMED automatically reacts to system events.

Thanks to the SMED's 96 MHz operating frequency and their automatic dithering function, the PWM maximum resolution is 1.3 ns.

The STNRG family has 6 SMEDs available. Multiple SMEDs can operate independently from each other or they can be grouped together to form a more powerful state machine.

The STNRG also integrates a low power STM8 microcontroller which is used to configure and monitor the SMED activity and to supply external communication such as the UART, I²C or DALI. The STM8 controller has full access to all the STNRG subsystems, including the SMEDs. The STNRG family also features a sequential ADC, which can be configured to continuously sample up to 8 channels.

Section : Block diagram illustrates the overall system block and shows how SMEDs have been implemented in the STNRG architecture.

Block diagram

Figure 2. Internal block diagram

5 Product overview

Section 5.1 describes the features implemented in the product device.

5.1 SMED (state machine event driven): configurable PWM generator

The SMED is an advanced programmable PWM generator signal. The SMED (state machine event driven) is a state machine device controllable by both external events (primary I/O signals) and internal events (counter timers), which generate an output signal (PWM) depending on the evolution of the internal state machine.

The PWM signal generated by the SMED is therefore shaped by external events and not only by a simple timer. This mechanism allows to generate controlled high frequency PWM signals.

The SMED is also autonomous: once it has been configured by the STNRG internal controller, the SMED can operate without any software interaction.

The STNRG family provides 6 SMED units. Multiple SMEDs can operate independently from each other or they can be grouped together to form a more powerful state machine.

The main features of a SMED are described here below:

- Configurable state machine generating a PWM signal
- More than 10.4 ns PWM native resolution
- Up to 1.3 ns PWM resolution when using SMED dithering
- 6 states available in each SMED: IDLE, S0, S1, S2, S3 plus a special HOLD state
- Transactions triggered by synchronous and asynchronous external events or an internal timer
- Each transaction can generate an interrupt
- Fifteen registers available to configure the state machine behavior
- Four 16-bit configurable time registers, one for each running state (T0, T1, T2, T3)
- Internal resources accessible through the processor interface
- Eight interrupt request lines
- Configurable ADC HW trigger request
- PWM pseudo open drain features configurable through GPIO1 registers

5.1.1 SMED coupling schemes

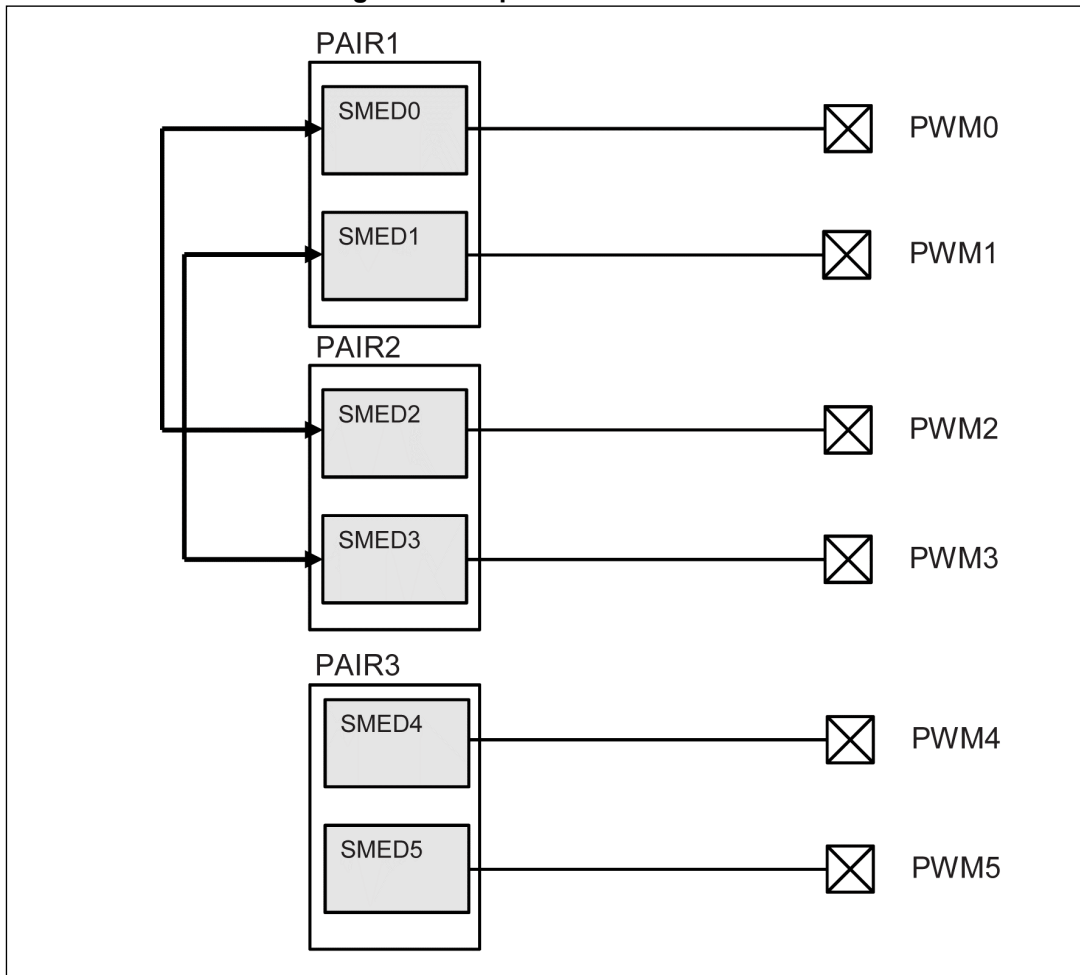

The SMED coupling extends the capability of the single SMED, preserving the independence of each “Finite State Machine” (FSM) programmed state evolution. The coupling scheme allows the SMED pulse signals to be interleaved on their own PWM or on a merged single PWM output. The STNRG supports the following coupled configuration schemes:

- Single SMED configuration
- Synchronous coupled SMED
- Asynchronous coupled SMED
- Synchronous two coupled SMEDs
- Asynchronous two coupled SMEDs
- External controlled SMED

The SMED units may be configured in different coupled schemes through the SMDx_GLBCONF and SMDx_DRVOUT bit fields of MSC_SMEDCFGxy registers.

An outline of the SMED subsystem is shown in *Figure 3*.

Figure 3. Coupled SMED overview

1. The PWM4 and PWM5 output pins are not present on all STNRG devices.

5.1.2 Connection matrix

The connection matrix extends the input connectivity of each SMED unit so that a SMED can receive events from a wide range of sources. Through the matrix, it's possible to connect the SMED inputs to various signal families such as digital inputs, comparator output signals, SW events, and three PWM internal feedback signals as shown in *Figure 4*.

The list of the available event sources is the following:

- DIGIN [5:0] digital input lines
- CPM [3:0] analog comparator outputs
- PWM [5:0] output signals of SMEDs (only PWM 0, 1 and 5 are accessible)
- SW [5:0] software events

Figure 4 shows the connection matrix and signal interconnections as they are implemented in the STNRG family.

Figure 4. SMED subsystem overview

1. The CPP2 and CMP3 inputs are connected together in some STNRG devices.

Connection matrix interconnection

Every SMED unit has three input selection lines, one for each In_Sig input, configurable via the MSC_CBOXS (5:0) register. The selection lines choose the interconnection between one of possible four connection matrix signals for each SMED input event In_Sig (Y).

Table 3 shows the layout of the connection matrix interconnection signals as implemented in the STNRG family.

Table 3. Connection matrix interconnection

| Conb_s(x)(y)(z) | | | | | |
|-----------------|------------|---------------------------------|------|------|------|
| SMED number | SMED input | SMED input signal selection (z) | | | |
| (x) | (y) | 00 | 01 | 10 | 11 |
| 0 | 0 | CP0 | DIG0 | DIG2 | DIG5 |
| | 1 | CP1 | DIG0 | DIG3 | CP3 |
| | 2 | CP2 | DIG1 | DIG4 | SW0 |
| 1 | 0 | CP1 | DIG1 | DIG3 | DIG0 |
| | 1 | CP2 | DIG1 | DIG4 | CP3 |
| | 2 | CP0 | DIG2 | DIG5 | SW1 |
| 2 | 0 | CP2 | DIG2 | DIG4 | DIG1 |
| | 1 | CP0 | DIG2 | DIG5 | PWM0 |
| | 2 | CP1 | DIG3 | DIG0 | SW2 |
| 3 | 0 | CP0 | DIG3 | DIG5 | DIG2 |
| | 1 | CP1 | DIG3 | DIG0 | PWM1 |
| | 2 | CP2 | DIG4 | DIG1 | SW3 |
| 4 | 0 | CP1 | DIG4 | DIG0 | DIG3 |
| | 1 | CP2 | DIG4 | DIG1 | PWM5 |
| | 2 | CP0 | DIG5 | DIG2 | SW4 |
| 5 | 0 | CP2 | DIG5 | DIG1 | DIG4 |
| | 1 | CP0 | DIG5 | DIG2 | CP3 |
| | 2 | CP1 | DIG0 | DIG3 | SW5 |

Connection matrix legend:

- X represents the SMED [5:0] number
- Y represents the SMED input signal number (In_Sig [2:0])
- Z represents the In_Sig (Y) selection signal

Note: Each SMED input has independent connection matrix selection signals.
Internal controller (CPU)

The STNRG family integrates a programmable STM8 controller acting as a device supervisor. The STM8 is a modern CISC core and has been designed for code efficiency and performance. It contains 21 internal registers (six of them directly addressable in each

execution context), 20 addressing modes including indexed indirect and relative addressing and 80 instructions.

5.1.3 Architecture and registers

- Harvard architecture with 3-stage pipeline
- 32-bit wide program memory bus with single cycle fetching for most instructions
- X and Y 16-bit index registers, enabling indexed addressing modes with or without offset and read-modify-write type data manipulations
- 8-bit accumulator
- 24-bit program counter with 16 Mbyte linear memory space
- 16-bit stack pointer with access to a 64-Kbyte stack
- 8-bit condition code register with seven condition flags updated with the results of last executed instruction

5.1.4 Addressing

- 20 addressing modes
- Indexed indirect addressing mode for lookup tables located in the entire address space
- Stack pointer relative addressing mode for efficient implementation of local variables and parameter passing

5.1.5 Instruction set

- 80 instructions with 2-byte average instruction size
- Standard data movement and logic/arithmetic functions
- 8-bit by 8-bit multiplication
- 16-bit by 8-bit and 16-bit by 16-bit division
- Bit manipulation
- Data transfer between stack and accumulator (push/pop) with direct stack access
- Data transfer using the X and Y registers or direct memory-to-memory transfers

5.1.6 Single wire interface module (SWIM)

The single wire interface module (SWIM), together with the integrated debug module (DM), allows non-intrusive, real-time in-circuit debugging and fast memory programming. The interface can be activated in all device operation modes and can be connected to a running device (hot plugging). The maximum data transmission speed is 145 byte/ms.

The SWIM pin is a multifunction signal. For further details refer to [Table 7: Port P1 I/O multiplexing signal](#) in [Section 7.3 on page 38](#).

5.1.7 Debug module

The non-intrusive debugging module is fully controllable through the external target emulator. Besides memory and peripheral operation, the CPU operation can also be monitored in real-time by means of shadow registers.

- R/W of RAM and peripheral registers in real-time
- R/W for all resources when the application is stopped
- Breakpoints on all program-memory instructions (software breakpoints), except for the interrupt vector table
- Two advanced breakpoints and 23 predefined breakpoint configurations

5.2 Basic peripherals

[Section 5.2.1](#) and [Section 5.2.2](#) describe the basic peripherals accessed by the internal CPU controller.

5.2.1 Vectored interrupt controller

- Nested interrupts with three software priority levels
- 21 interrupt vectors with hardware priority
- Two vectors for 12 external maskable or un-maskable interrupt request lines
- Trap and reset interrupts

5.2.2 Timers

The STNRG family provides several timers which are used by software and do not interact directly with the SMED and the PWM generation.

System timers

The system timer consists of a 16-bit autoreload counter driven by a programmable prescaled clock and operating in one shoot or free running operating mode. The timer is used to provide the IC time base system clock, with an interrupt generation on timer overflow events.

Basic timers

The IC device includes two independent 6-bit timers programmable through the miscellaneous indirect register area. The time base frequency is configurable with different source clocks.

The timers have the following functionalities:

- Free running mode
- Timer prescaler 8-bits
- Counter register 6-bits
- Programmable time base clock (HSI, HSE, LSI, PLL)
- Interrupt timer capability:
 - Vectored interrupt
 - Interrupt IRQ/NMI or polling mode

Auxiliary timer

The auxiliary timer is a light timer with elementary functionality. The time base frequency is provided by the CCO clock logic (configurable with a different source clock and prescale division factors), while the interrupt functionality is supplied by an interrupt edge detection logic similarly to the solution adopted for the Port P0/P2.

The timer has the following main features:

- Free running mode
- Up counter
- Timer prescaler 8-bit
- Interrupt timer capability:
 - Vectored interrupt
 - Interrupt IRQ/NMI or Polling mode
- Timer pulse configurable as a clock output signal via the CCO primary pin

Thanks to the great configurability of the CCO frequency, the timer can cover a wide range of interval time to fit better the target application requirements.

Auto-wakeup timer

The AWU timer is used to cyclically wake-up the IC device from the active halt state. The AWU frequency time base f_{AWU} can be selected between the following clock sources: LSI (153.6 kHz) and the external clock HSE scaled down to 128 kHz clock.

By default the f_{AWU} clock is provided by the LSI internal source clock.

Watchdog timers

The watchdog system is based on two independent timers providing a high level of robustness to the applications. The watchdog timer activity is controlled by the application program or by suitable option bytes. Once the watchdog is activated, it cannot be disabled by the user program without going through reset.

Window watchdog timer

The window watchdog is used to detect the occurrence of a software fault, usually generated by external interferences or by unexpected logical conditions, which causes the application program to break the normal operating sequence.

The window function can be used to adjust the watchdog intervention period in order to match the application timing perfectly. The application software must refresh the counter before timeout and during a limited time window. If the counter is refreshed outside this time window, a reset is issued.

Independent watchdog timer

The independent watchdog peripheral can be used to solve malfunctions due to hardware or software failures.

It is clocked by the 153.6 kHz LSI internal RC clock source. By properly setting the hardware watchdog feature associated option bits, the watchdog is automatically enabled at power-on, and generates a reset unless the key register is written by software before the counter reaches the end of the count.

5.2.3 Flash program and data E²PROM

Embedded Flash and E²PROM with the memory ECC code correction and protection mechanism preventing embedded program hacking.

- 32 Kbyte of single voltage program Flash memory
- 1 Kbyte true (not emulated) data E²PROM
- Read while write: writing in the data memory is possible while executing code program memory
- The device setup is stored in a user option area in the non-volatile memory.

5.2.4 Architecture

Figure 5. Flash and E²PROM internal memory organizations

- The memory is organized in blocks of 128 bytes each
- Read granularity: 1 word = 4 bytes
- Write/erase granularity: 1 word (4 bytes) or 1 block (128 bytes) in parallel
- Writing, erasing, word and block management is handled automatically by the memory interface.

5.2.5 Write protection (WP)

Write protection in application mode is intended to avoid unintentional overwriting of the memory. The write protection can be removed temporarily by executing a specific sequence in the user software.

5.2.6 Protection of user boot code (UBC)

In STNRG devices a memory area of 32 Kbyte can be protected from overwriting at a user option level. In addition to the standard write protection, the UBC protection can be modified by the embedded program or via debug interface when the ROP protection is enabled.

The UBC memory area contains the reset and interrupt vectors and its size can be adjusted in increments of 512 bytes by programming the UBC and nUBC option bytes.

Note: If users choose to update the boot code in the application programming (IAP), this has to be protected so to prevent unwanted modification.

5.2.7 Read-out protection (ROP)

The STNRG family provides a read-out protection of the code and data memory which can be activated by an option byte setting.

The read-out protection prevents reading and writing program memory, data memory and option bytes via the debug module and SWIM interface. This protection is active in all device operation modes. Any attempt to remove the protection by overwriting the ROP option byte triggers a global erase of the program and data memory contents.

5.3 Clock controller

The clock controller distributes the system clock provided by different oscillators to the core and the peripherals. It also manages clock gating for low- power modes and ensures clock robustness.

The main clock controller features are:

- Clock sources
- Internal 16 MHz and 153.6 kHz RC oscillators
- External source clock:
 - Crystal/resonator oscillator
 - External clock input
- Internal PLL at 96 MHz (not used as the f_{MASTER} source clock)
- Reset: after the reset the microcontroller restarts by default with the HSI internal clock scaled at 2 MHz (16 MHz/8). The clock source and speed can be changed by the application program as soon as the code execution starts.
- Safe clock switching: clock sources can be changed safely on the fly in run mode through a configuration register. The clock signal is not switched until the new clock source is ready. The design guarantees glitch-free switching.
- Clock management: to reduce power consumption, the clock controller can stop the clock to the core or individual peripherals.
- Wakeup: In in case the device wakes up from low- power modes, the internal RC oscillator (16 MHz/8) is used for a quick startup. After a stabilization time, the device brings back the clock source that was selected before Halt mode was entered.
- Clock security system (CSS): the CSS permits monitoring of external clock sources and automatic switching to the internal RC (16 MHz/8) in case of a clock failure.
- Configurable main clock output (CCO): this feature permits to output an internal clock source signal for application usage.

5.3.1 Internal 16 MHz RC oscillator (HSI)

The high speed internal (HSI) clock is the default master clock line, generated by an internal RC oscillator and with nominal frequency of 16 MHz. It has the following major features:

- RC architecture
- Glitch-free oscillation
- 3-bit user calibration circuit.

5.3.2 Internal 153.6 kHz RC oscillator (LSI)

The low speed internal (LSI) clock is a low speed clock line provided by an internal RC circuit. It drives both the independent watchdog (IWDG) circuit and the auto-wakeup unit (AWU). It can also be used as a low power clock line for the master clock f_{MASTER} .

5.3.3 Internal 96 MHz PLL

The PLL provides a high frequency 96 MHz clock used to generate high frequency and accurate PWM waveforms. The input reference clock must be 16 MHz and may be sourced either by the internal HSI signal or by the external HSE auxiliary input crystal oscillator line.

The internal PLL prescaled clock cannot be selected as f_{MASTER} .

Note: When the application requires a PWM signal with a custom defined long term stability it is suggested to use an external clock source connected to the HSE auxiliary clock line as the PLL input reference clock. In this case, the external clock source accuracy determines the PWM output stability.

5.3.4 External clock input/crystal oscillator (HSE)

The high speed external clock (HSE) allows the connection of an external clock generated, for example, by a highly accurate crystal oscillator. The HSE is interconnected with the f_{MASTER} clock line and to several peripherals. It allows users to provide a custom clock characterized by a high level of precision and stability to meet the application requirements. The HSE supports two possible external clock sources with a maximum of 24 MHz:

- Crystal/ceramic resonator interconnected with the HseOscin/HseOscout signals
- Direct drive clock interconnected with the HseOscin signal

The HseOscin and HseOscout signals are multifunction pins configurable through the I/O multiplex mechanism; for further information refer to Section 6 on page 30.

*Note: When the HSE is configured as the f_{MASTER} source clock, the HSE input frequency cannot be higher than 16 MHz.
When the HSE is the PLL input reference clock, then the HSE input frequency must be equal to 16 MHz.
If the HSE is the reference for the SMED or the ADC logic, the input frequency can be configured up to 24 MHz.*

5.4 Power management

For efficient power management, the application can be put in one of four different low-power modes. Users can configure each mode to obtain the best compromise between the lowest power consumption, the fastest startup time and available wakeup sources.

- **Wait mode:** in this mode, the CPU is stopped, but peripherals are kept running. The wakeup is triggered by an internal or external interrupt or reset.
- **Active- halt mode with regulator on:** in this mode, the CPU and peripheral clocks are stopped. An internal wakeup is generated at programmable intervals by the auto-wakeup unit (AWU). The main voltage regulator is kept powered on, so current consumption is higher than in the active-halt mode with the regulator off, but the wakeup time is faster. The wakeup is triggered by the internal AWU interrupt, external interrupt or reset.
- **Active- halt mode with regulator off:** this mode is the same as active- halt with the regulator on, except that the main voltage regulator is powered off, so the wakeup time is slower.
- **Halt mode:** in this mode the microcontroller uses the least power. The CPU and peripheral clocks are stopped, while the main voltage regulator is switched in power-off. Wakeup is triggered by an external event or reset.

In all modes the CPU and peripherals remain permanently powered on, the system clock is applied only to selected modules. The RAM content is preserved and the brownout reset circuit remains enabled.

5.5 Communication interfaces

5.5.1 Universal asynchronous receiver/transmitter (UART)

UART is the asynchronous receiver/transmitter communication interface.

- SW flow control operating mode
- Full duplex, asynchronous communications
- High precision baud rate generator system
- Common programmable transmit and receive baud rates up to $f_{\text{MASTER}}/16$
- Programmable data word length (8 or 9-bit)
- Configurable stop bit - support for 1 or 2 stop bit
- Configurable parity control
- Separate enable bits for transmitter and receiver
- Interrupt sources:
 - Transmit events
 - Receive events
 - Error detection flags
- 2 interrupt vectors:
 - Transmitter interrupt
 - Receiver interrupt
- Reduced power consumption mode
- Wakeup from mute mode (by idle line detection or address mark detection)
- 2 receiver wakeup modes:
 - Address bit (MSB)
 - Idle line.

5.5.2 Inter-integrated circuit interface (I²C)

The I²C (inter-integrated circuit) bus interface serves as an interface between the microcontroller and the serial I²C bus. It provides a multi-master capability, and controls all I²C bus-specific sequencing, protocol, arbitration and timing. It supports standard and fast speed modes.

- Parallel-bus/I²C protocol converter
- Multi-master capability: the same interface can act as master or slave
- I²C master features:
 - Clock generation
 - Start and stop generation
- I²C slave features:
 - Programmable I²C address detection
 - Stop bit detection
- Generation and detection of 7-bit/10-bit addressing and general call
- Supports different communication speeds:
 - Standard speed (up to 100 kHz)
 - Fast speed (up to 400 kHz)

- Status flags:
 - Transmitter/receiver mode flag
 - End-of-byte transmission flag
 - I²C busy flag
- Error flags:
 - Arbitration lost condition for master mode
 - Acknowledgment failure after address/ data transmission
 - Detection of misplaced start or stop condition
 - Overrun/underrun if clock stretching is disabled
- Interrupt sources:
 - Communication interrupt
 - Error condition interrupt
 - Wakeup from Halt interrupt
- Wakeup capability:
 - MCU wakes up from low power mode on address detection in slave mode.

5.5.3 Digital addressable lighting interface (DALI)

The DALI (digital addressable lighting interface), standardized as IEC 62386, is the new interface for lighting control solutions defined by the lighting industry.

The DALI protocol is generally implemented in a DALI communication module (DCM): a serial communication circuit designed for controllable electronic ballasts. The “ballast” is a device or circuit used to provide the required starting voltage and operating current for the LED, fluorescent, mercury or other electronic-discharge lamps.

The STNRG388A DALI interface has the following characteristics:

- Speed line: 1.2, 2.4 and 4.8 kHz transmission rate $\pm 10\%$
- Forward message length: 16, 17, 18 or 24 bit
- Backward message length: 8 bit
- Bidirectional communications
- Monitor receiver line timeout 500 ms $\pm 10\%$
- Reversible polarity of DALI_rx, DALI_tx signal line
- Configurable noise rejection filter on DALI_rx input line
- Maskable interrupt request line
- DALI peripheral clock is slowed down to 153.6 kHz in low speed operating mode

DALI noise rejection filter

The DALI interface includes a noise rejection filter interconnected on the RX channel capable to remove any bounce, glitch or spurious pulse from the RX line. The filter can be configured via three registers:

- MSC_DALICKSEL: selects the source clock of filter timing
- MSC_DALICKDIV: configures the clock prescaler value
- MSC_DALICONF: configures the filter count and operating mode.

Further information about the noise rejection filter description is found in the STLUX and STNRG family reference manual (RM0380).

5.6 Analog-to-digital converter (ADC)

The STNRG family includes a 10-bit successive approximation ADC with 8 multiplexed input channels. The analog input signal can be amplified before conversion by a selectable gain of 1 or 4^(a) times. The analog-to-digital converter can operate either in single or in continuous/circular modes. The ADC unit has the following main features:

- 8/6 ADC input channel^(b)
- 10-bit resolution
- Single and continuous conversion mode
- Independent or fixed channel gain value x1 or x4 to extend dynamic range and resolution to 12-bit equivalent^(a)
- Interrupt events:
 - EOC interrupt asserted on end of conversion cycle
 - EOS interrupt asserted on end of conversion sequences
 - SEQ_FULL_EN interrupt assert on sequencer buffer full
- ADC input voltage range dependent on selected gain value^(a)
- Selectable conversion data alignment
- Individual registers for up to 8 successive conversions.
- Conversion start from SW command or HW trigger event
- Auto-reload conversion command parameters
- Auto-flush after single conversion mode
- Auto-flush after conversion mode program (single/circular)
- Abort/flush sequence improvement

5.7 Analog comparators

The STNRG family includes four independent fast analog comparator units (COMP3-0). Each comparator has an internal reference voltage. The COMP3 can be also configured to use an external reference voltage connected to the CPM3 input pin. On the STNRG388A each comparator has also the external reference voltage line pin.

a. The gain x 4 is available only on the STNRG388A type.

b. The numbers of ADC input channels depends on the STNRG device.

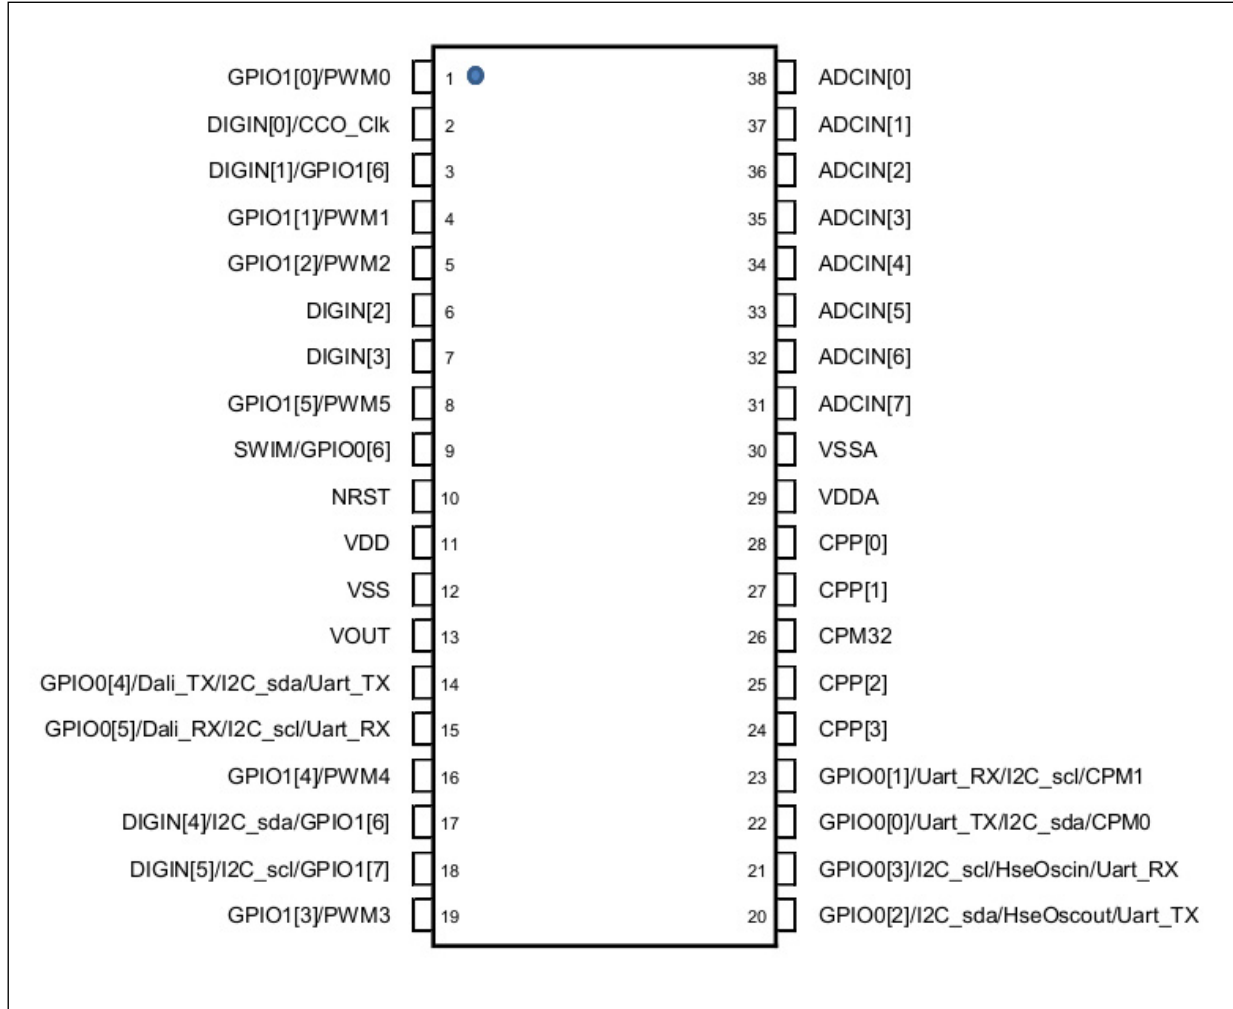

Each comparator internal reference voltage is generated by a dedicated internal-only 4-bit DAC unit. The main characteristics of the analog comparator unit (ACU) are the following:

- Each comparator has an internally/external configurable reference
- Internal reference voltages configurable in 16 steps with the 83 mV voltage gain from 0 V (VSSA) to 1.24 V (voltage reference)
- Two stage comparator architecture is used to reach a high gain
- Comparator output stage value accessible from processor interface
- Continuous fast cycle comparison time
- Configurable hysteresis voltage levels
- Configurable ADC HW trigger request
- Comparator outputs interrupt capability.

6.3 Input/output specifications

The STNRG family includes three different I/O types:

- Normal I/Os configurable either at 2 or 10 MHz maximum frequency
- Fast I/O operating up to 12 MHz.
- High speed I/O operating up to 32 MHz

The STNRG I/Os are designed to withstand current injection. For a negative injection current of 4 mA, the resulting leakage current in the adjacent input does not exceed 1 μ A; further details are available in [Section 12 on page 81](#).

7 I/O multifunction signal configuration

Several I/Os have multiple functionalities selectable through the configuration mechanism described from [Section 7.1](#) to [Section 7.5 on page 41](#). The STNRG I/Os are grouped into four different configurable ports: P0, P1, P2 and P3.

7.1 Multifunction configuration policy

STNRG devices support either a cold or warm multifunction signal configuration policy according to the content of the EN_COLD_CFG bit field, a part of the GENCFG option byte register.

When the EN_COLD_CFG bit is set, the cold configuration is selected and the multifunction signals are configured according to the values stored in the option bytes; otherwise when the EN_COLD_CFG bit is cleared (default case), the warm configuration mode is chosen and the multifunction pin functionality is configured through the miscellaneous registers.

The configuration options and the proper configuration registers are detailed in [Table 5](#).

Table 5. Multifunction configuration registers

| EN_COLD_CFG | Configuration policy | Multifunction configuration registers |
|-------------|----------------------|--|
| 1 | Cold | AFR_IOMUXP0, AFR_IOMUXP1 and AFR_IOMUXP2 |
| 0 (default) | Warm | MSC_IOMUXP0, MSC_IOMUXP1 and MSC_IOMUXP2 |

The warm configuration is volatile, thus not maintained after a device reset.

7.2 Port P0 I/O multifunction configuration signal

The Port P0 multiplexes several input/output functionalities, increasing the device flexibility. The P0 port pins can be independently assigned to general purpose I/Os or to internal peripherals. All communication peripherals and the external oscillator are hosted by the Port P0 pins.

In order to avoid electrical conflicts on the user application board, the P0 signals are configured at reset as GPIO0 inputs without pull-up resistors. Once reset is released, the firmware application must initialize the inputs with the proper configuration according to the application needs.

7.2.1 Alternate function P0 configuration signals

The multifunction pins can be configured via one of the following two registers, depending on the overall configuration policy (warm/cold):

- Cold configuration: AFR_IOMUXP0 option byte registers (refer to [Section 10 on page 63](#). After the reset the P0 signals are configured in line with AFR_IOMUXP0 contents.
- Warm configuration: MSC_IOMUXP0 miscellaneous register (refer to [Section 7.5 on page 41](#)). After the reset, the P0 signals are configured as GPIO input lines with the pull-up disabled.

Table 6 summarizes the Port P0 configuration scheme. Both registers MSC_IOMUXP0 and AFR_IOMUXP0 use the same register fields Sel_p054, Sel_p032 and Sel_p010 which respectively control the bits [5, 4], [3, 2] and [1, 0] of the Port P0.

Table 6. P0 internal multiplexing signals⁽¹⁾

| Port P0 multifunction configuration signal | | | | |
|--|-----------------------|---------------------|------------------|------------------------|
| Port pins | Multifunction signal | | MUX SEL | |
| | | | Selection fields | Value (binary) |
| P0 [1,0] ⁽²⁾ | GPIO0 [1] | GPIO0 [0] | Sel_p010 | 00 ^{(3), (4)} |
| | CPM1 ⁽³⁾ | CPM0 ⁽⁴⁾ | | 01 |
| | UART_rx | UART_tx | | 10 |
| | I2C_scl | I2C_sda | | 11 |
| | RFU reserved encoding | | | |
| P0 [3, 2] | GPIO0 [3] | GPIO0 [2] | Sel_p032 | 00 |
| | I2C_scl | I2C_sda | | 01 |
| | HseOscin | HseOscout | | 10 |
| | UART_rx | UART_tx | | 11 |
| P0 [5, 4] | GPIO0 [5] | GPIO0 [4] | Sel_p054 | 00 |
| | DALI_rx | DALI_tx | | 01 |
| | I2C_scl | I2C_sda | | 10 |
| | UART_rx | UART_tx | | 11 |

1. The Sel_p054, Sel_p032, Sel_p010 are register fields for both registers MSC_IOMUXP0 and AFR_IOMUXP0. The peripheral conflict (same resources selected on different pins at the same time) has to be prevented by SW configuration. When the I²C interface is selected either on the GPIO0 [5:4] or on the GPIO0 [3:2] signals the related I/O port speed has to be configured at 10 MHz by programming the GPIO0 internal peripheral.
2. Available only on STNRG388A.
3. The CPM1 (external COMP1 reference voltage) selection line requires the following configurations: GPIO0 [1] programmed as input Hiz and the bit field DAC1_EN = '0' and CP1_EN_ERef = '1' of MSC_DACCTR (available only on the STNRG388A).
4. The CPM0 (external COMP0 reference voltage) selection line requires the following configurations: GPIO0 [0] programmed as input Hiz (input high impedance with pull-up disable) and the bit field DAC0_EN = '0' and CP0_EN_ERef = '1' of MSC_DACCTR (available only on the STNRG388A).

7.2.2 Port P0 diagnostic signals

The primary I/Os can be used to trace the SMED's state evolution. This feature allows the debug of the complex SMED configurations. The trace selection can be enabled or disabled via register MSC_IOMXSMD. The diagnostic signal selection through MSC_IOMXSMD register overrides the functional configuration of MSC_IOMUXP0 register.

The Port P0 [5:3] or P0 [2:0] can be configured to output one or two different SMEDs' current states.

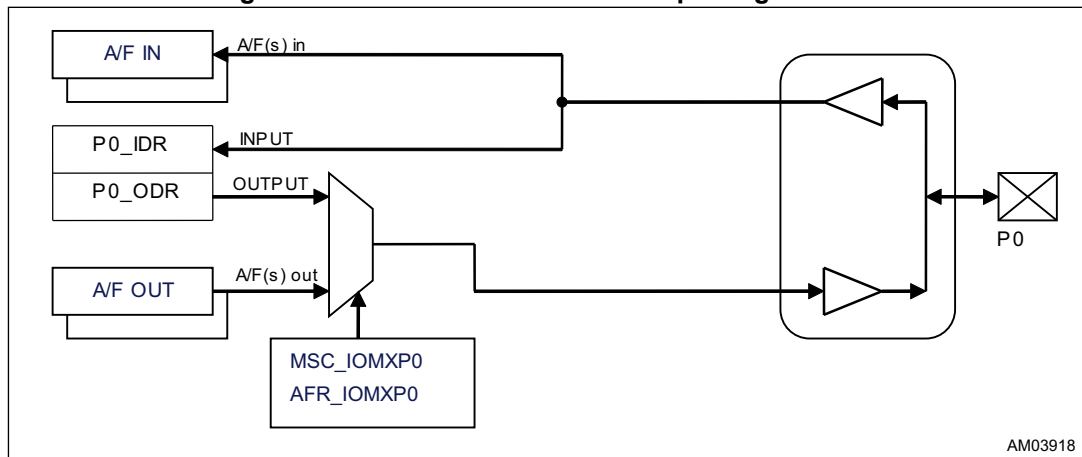

The SMEDs FSM state signals (coded on three bits) may be multiplexed either on port bits P0 [5:3] or P0 [2:0]; alternatively two different SMEDs signal states can be traced

simultaneously on the same port bits. The SMED trace configuration is forbidden on the Port P [2:0] when the external comparator reference voltage is programmed on the Port P0 [1, 0].
Port 0 I/O signal availability depends on the STNRG device.

7.2.3 Port P0 I/O functional multiplexing signal

Figure 7 shows an outline view of the Port P0 multifunction multiplexing scheme.

Figure 7. Port P0 I/O functional multiplexing scheme

1. Where "A/F(s) in" and "A/F(s) out" signals are defined in Section 5.2 on page 28.
Verify pinout availability in device pin table X?
The P0 [6] is a multifunction signal configurable through the MSC_IOMUXP2 [7] and AFR_IOMUXP2 [7] register bits. For further details refer to Section-6.4.
The Port P0 [6] signal is controlled by P0_ODR [6] and P0_IDR [6] GPIO0 registers.

7.2.4 P0 interrupt capability

Port P0 signals may be configured to generate maskable (IRQ) and un-maskable (NMI) interrupts by programming the MSC_CFGP0<n> and the MSC_STSP0 registers (n = index port signal).

The interrupt request may be configured to wake-up the IC device from the WFI (wait for interrupt), AHalt (active Halt) and Halt power saving state.

7.2.5 P0 programmable pull-up and speed feature

The I/O speed and pad pull-up resistance (47 kΩ) of the port P0 may be configured through the GPIO0 internal registers.

The pull-up resistance of the multifunction signal P0 [6] is always enabled.

7.3 Port P1 I/O multifunction configuration signal

The Port P1 I/O multifunction pins, similarly to the Port P0, can be individually configured through the following set of registers based on the selected device configuration policy:

- Cold configuration: AFR_IOMUXP1 option byte register (refer to [Section 10 on page 63](#)). After reset the P1 signals are configured in line with AFR_IOMUXP1 contents.
- Warm configuration: MSC_IOMUXP1 miscellaneous register (refer to [Section 7.5](#)). After reset the P1 signals are configured as PWM output lines.

Every Port1 I/O can be configured to operate as a PWM output pin or a GPIO. Differently from the port P0s, the pins are configured as PWM output signals by default after reset.

[Table 7](#) summarizes the Port P1 configurations as selected by the register fields Sel_p15 ... Sel_p10 which respectively control the bits [5] ... [0] of the Port P1 (verify resources availability on [Table 4: Pin description on page 32](#)).

Table 7. Port P1 I/O multiplexing signal⁽¹⁾

| Port P1 multifunction configuration signal | | | |
|--|------------------------|----------------|----------------|
| Output signal | Multi- function signal | MUX selection | |
| | | Selection bits | Value (binary) |
| P1 [0] | PWM [0] | Sel_p10 | 1 |
| | GPIO1 [0] | | 0 |
| P1 [1] | PWM [1] | Sel_p11 | 1 |
| | GPIO1 [1] | | 0 |
| P1 [2] | PWM [2] | Sel_p12 | 1 |
| | GPIO1 [2] | | 0 |
| P1 [3] | PWM [3] | Sel_p13 | 1 |
| | GPIO1 [3] | | 0 |
| P1 [4] | PWM [4] | Sel_p14 | 1 |
| | GPIO1 [4] | | 0 |
| P1 [5] | PWM [5] | Sel_p15 | 1 |
| | GPIO1 [5] | | 0 |

1. The Sel_p15...Sel_p10 are common register fields of both registers MSC_IOMUXP1 and AFR_IOMUXP1. In cold configuration the P1x are configured as defined by the AFR_IOMUXP1 option byte. The PWM default polarity level is configured by the register option byte GENCFG. Verify pin out availability in [Table 4: Pin description on page 32](#).

7.3.1 Port P1 I/O multiplexing signal

Figure 8 shows an outline view of the port P1 signal multiplexing scheme.

Figure 8. Port P1 I/O multiplexing scheme

1. The P1 [5:0] output signals may be read back from the P1_IDR register only when the pins are configured as GPIO out or PWM signals. The PWM internal signal is read-back also by its own SMED through the SMD<n>_FSM_STS register. P1_ODR [7:6] and P1_IDR [7:6] registers control the GPIO1 [7:6] alternate function signals, for further details refer to [Section 7.4](#). Check device feature availability.

7.3.2 P1 interrupt capability

Port P1 signals may be configured to generate maskable (IRQ) and un-maskable (NMI) interrupts by configuring the MSC_CFGP1<n> and the MSC_STSP1 registers (n = index port signal 4- 0). This functionality is applicable to the bit port P1 [4:0].

The interrupt request may be configured to wake-up the IC device from the WFI (wait for interrupt), AHalt (active Halt) and Halt power saving state.

7.3.3 P1 programmable pull-up feature

The pad pull-up resistances (47 kΩ) of the Port1 may be configured through the GPIO1 internal register.

The PWM output pseudo open drain functionality is controllable by the GPIO1 registers.

7.4 Port P2 I/O multifunction configuration signal

The Port2 I/O multifunction pins, similarly to the Port0 and Port2, can be individually configured through the following set of registers based on the selected device configuration policy:

- Cold configuration: AFR_IOMUX2 option byte registers (refer to [Section 10 on page 63](#)). After reset the P2 signals are configured in line with AFR_IOMUX2 contents.
- Warm configuration: MSC_IOMUX2 miscellaneous register (refer to [Section 7.5](#)). After reset the P2 signals are configured as DIGIN input lines with pull-up enabled.

[Table 8](#) summarizes the port P2 configurations selected by the register fields Sel_p25 ... Sel_p20 which respectively control the bits [5]... [0] of the port P2. The P2 [0] is configured by the CCOEN bit field of the register CKC_CCOR. The SWIM alternate function signal

(when available) is controlled by the Sel_SWIM bit field provided by registers AFR_IOMUXP2 [7] and MSC_IOMUXP2 [7].

Table 8. Port P2 I/O multiplexing signal⁽¹⁾

| Port P2 multifunction configuration signal | | | | |
|--|-----------------------|-----------|----------------|-------------------|
| Output signal | Multi-function signal | | MUX SEL | |
| | | | Selection bits | Value (binary) |
| P2 [0] | DIGIN [0] | | CCOEN | 0 ⁽²⁾ |
| | CCO | | | 1 |
| P2 [1] | GPIO1 [6] | | Sel_P21 | 0 |
| | DIGIN [1] | | | 1 ⁽²⁾ |
| P2 [3] | GPIO0 [7] | | Sel_P23 | 0 |
| | DIGIN [3] | | | 1 ⁽²⁾ |
| P2 [5, 4] | GPIO1 [7] | GPIO1 [6] | Sel_P2 [5, 4] | 00 |
| | GPIO1 [7] | DIGIN [4] | | 01 |
| | I2C_scl | I2C_sda | | 10 |
| | DIGIN [5] | DIGIN [4] | | 11 ⁽²⁾ |
| SWIM | SWIM | | Sel_SWIM | X ⁽³⁾ |
| | GPIO0 [6] | | | 0 ⁽⁴⁾ |
| | DIGIN1 (3) | | | 1 |

1. The Sel_P2 [5, 4, 3, 1] is a common register field of both registers MSC_IOMUXP2 and AFR_IOMUXP2. The peripheral conflict (same resources selected on different pins at the same time) has to be prevented by SW configuration.
After reset by default P2 [3, 1, 0] are configured as DIGIN [3, 1, 0] signals.
The option byte AFR_IOMUXP2, before user configuration, by default selects the I²C alternative functionality.
The signal ports P2 [3:1] are exclusively interconnected with DIGIN [3:1] primary pins. When the I²C i/f is selected on DIGIN [5:4] signals the I/O speed is auto-configured at 10 MHz and the internal pull-up functionality is controlled by the MSC_INPP2AUX1 register.
After reset by default the P2 [0] is configured as the DIGIN [0] signal.
GPIO1 [7:6] signals are controlled by P1_ODR [7:6] and P1_IDR [7:6] GPIO1 registers.
2. Default configuration after reset if the option byte is at the manufactory value.
Verify pin out availability in device pin table X.
3. SWIM pin: SWIM signal function is selected when CFG_GCR [0] = '0'.
4. SWIM pin: The GPIO0 [6] signal is selected when both Sel_SWIM = '0' and CFG_GCR [0] = '1'.

7.4.1 P2 ADC hardware trigger

The DIGIN [0, 3] signals may be configured to generate a HW trigger request to start the ADC conversion.

7.4.2 P2 interrupt capability

Port P2 signals may be configured to generate maskable (IRQ) and un-maskable (NMI) interrupts by configuring the MSC_CFGP2<n> and the MSC_STSP2 registers (n = index port signal 0 - 5).

The interrupt functionality is available on the port P2 [5:4] also in case these signals are configured as GPIO1 [7:6].

The interrupt request may be configured to wake-up the IC device from the WFI (wait for interrupt), AHalt (active Halt) and Halt power saving state.

7.4.3 P2 programmable pull-up feature

The pad pull-up resistances (47 k Ω) of Port2 signals are individually controllable by the MSC_INPP2AUX1 register.

7.5 Port P3 analog signal

The port P3 is an analog signal port based on the comparator input signals CPP [3:0]. Differently than the digital ports, the P3 is a single function port with fixed signal assignment.

7.5.1 P3 ADC conversion request

The CMP [0, 3] internal output signals may be configured to generate a HW trigger request to start the ADC conversion.

7.5.2 P3 interrupt capability

The comparator output signals of the port P3 (CMP [3:0]) may be configured to generate maskable interrupts by programming the MSC_CFGP3<n> and the MSC_STSP3 registers (n = index port signal 0-3).

The interrupt request may be configured to wake-up the IC device from the WFI (wait for interrupt), AHalt (active Halt) and Halt power saving state.

7.6 Multifunction port configuration registers

MSC_IOMUXP0 (Port P1 I/O MUX control register)

Table 9. MSC_IOMUXP0 (Port P1 I/O MUX control register)

| Offset: 0x2A | | | | | | | |

Check device feature availability.

Bit 5 - 0:
 INPP2_PULCTR [5:0]. This register configures respectively the INPP2 [5:0] pull-up functionality as follows:
 0: enable pad pull-up features (enabled by default)
 1: disable pad pull-up

Bit 6:
 RFU reserved; in order to guarantee future compatibility, the bits are kept or set to 0 during register write operations.

Bit 7:
 ADCTRG_EN controls the ADC HW triggered conversion request:
 0: disable the ADC HW triggered conversion request (disabled by default)
 1: enable the ADC HW triggered conversion request. Set/cleared by SW. Cleared by HW when SW/HW conversion starts or when the stop command is issued

Note: Due to DIGINs interconnections, the pull-up functionality must be configured in the same way if the two pins are connected together:

- *DIGIN10 is controlled by the register field INPP2_PULCTR [1:0]*
- *DIGIN32 is controlled by the register field INPP2_PULCTR [3:2]*
- *DIGIN54 is controlled by the register field INPP2_PULCTR [5:4].*

When the DIGIN1 signal is selected on the SWIM pin the pull-up is always enabled.

8 Memory and register map

8.1 Memory map overview

This section describes the register map implemented in STNRG devices. [Table 13](#) shows the main memory map organization. All registers and memory spaces are configured within the first 64 Kbytes of memory, the remaining address spaces are kept reserved for the future use.

Table 13. Internal memory map

| Address | Description |
|----------------------|--|
| 00.0000h 00.17FFh | 6 kB RAM [data and stack area ⁽¹⁾] |
| 00.1800h 00.3FFFh | Reserved |
| 00.4000h 00.43FFh | 1 kB data E ² PROM |
| 00.4400h 00.47FFh | Reserved |
| 00.4800h 00.487Fh | 128 option bytes |
| 00.4880h 00.4FFFh | Reserved |
| 00.5000h 00.57FFh | Peripheral register region |
| 00.5800h 00.5FFFh | Reserved |
| 00.6000h 00.67FFh | 2 kB boot ROM |
| 00.6800h 00.7EFFh | Reserved |
| 00.7F00h 00.7FFFh | Core register region |
| 00.8000h | 32 interrupt vectors |
| 00.8080h 00.FFFFh | 32 kB program Flash |
| 01.0000h FF.FFFFh | Reserved |

1. By default, the stack address is initialized at 0x07FF and rolls over when it reaches the address value of 0x0400. The stack address value may be modified by the user at runtime.

8.2 Register map

Section 8.2.1 shows the STNRG memory map.

8.2.1 General purpose I/O GPIO0 register map

Table 14. General purpose I/O GPIO0 register map

| Address | Block | Register name | Register description |
|-----------|-------|---------------|----------------------|
| 0x00.5000 | GPIO0 | P0_ODR | Output data |
| 0x00.5001 | | P0_IDR | Input data |
| 0x00.5002 | | P0_DDR | Data direction |
| 0x00.5003 | | P0_CR1 | Control register 1 |
| 0x00.5004 | | P0_CR2 | Control register 2 |

8.2.2 General purpose I/O GPIO1 register map

Table 15. General purpose I/O GPIO0 register map

| Address | Block | Register name | Register description |
|-----------|-------|---------------|----------------------|
| 0x00.5005 | GPIO1 | P1_ODR | Output data |
| 0x00.5006 | | P1_IDR | Input data |
| 0x00.5007 | | P1_DDR | Data direction |
| 0x00.5008 | | P1_CR1 | Control register 1 |
| 0x00.5009 | | P1_CR2 | Control register 2 |

8.2.3 Miscellaneous registers

Direct register address mode

Table 16. Miscellaneous direct register address mode

| Address | Block | Register name | Register description |
|-----------|-------|---------------|---|
| 0x00.5010 | MSC | MSC_CFGP00 | P00 input line control |
| 0x00.5011 | | MSC_CFGP01 | P01 input line control |
| 0x00.5012 | | MSC_CFGP02 | P02 input line control |
| 0x00.5013 | | MSC_CFGP03 | P03 input line control |

8.2.4 Flash and E²PROM non-volatile memories

Table 18. Non-volatile memory register map

| Address | Block | Register name | Register description |
|-----------|-------|---------------|--|
| 0x00.505A | MIF | FLASH_CR1 | Control register 1 |
| 0x00.505B | | FLASH_CR2 | Control register 2 |
| 0x00.505C | | FLASH_nCR2 | Control register 2 (protection) |
| 0x00.505D | | FLASH_FPR | Memory protection |
| 0x00.505E | | FLASH_nFPR | Memory protection (complemented register) |
| 0x00.505F | | FLASH_IAPSR | Flash status |
| 0x00.5062 | | FLASH_PUKR | Write memory protection removal key register |
| 0x00.5063 | | RFU | Reserved for future use |
| 0x00.5064 | | FLASH_DUKR | Write memory protection removal data |
| 0x00.5071 | | FLASH_WAIT | Time access wait-state reg. |

8.2.5 Reset register

Table 19. RST_SR register map

| Address | Block | Register name | Register description |
|-----------|-------|---------------|----------------------|
| 0x00.50B3 | RSTC | RST_SR | Reset control status |

8.2.6 Clock controller register

Table 20. Clock controller register map

| Address | Block | Register name | Register description |
|-----------|-------|---------------|----------------------------|
| 0x00.50B4 | CKC | CLK_SMD0 | SMED 0 clock configuration |
| 0x00.50B5 | | CLK_SMD1 | SMED 1 clock configuration |
| 0x00.50B6 | | CLK_SMD2 | SMED 2 clock configuration |
| 0x00.50B7 | | CLK_SMD3 | SMED 3 clock configuration |
| 0x00.50B8 | | CLK_SMD4 | SMED 4 clock configuration |
| 0x00.50B9 | | CLK_SMD5 | SMED 5 clock configuration |
| 0x00.50BA | | RFU | Reserved for future use |
| 0x00.50BB | | RFU | Reserved for future use |
| 0x00.50BC | | RFU | Reserved for future use |
| 0x00.50BD | | RFU | Reserved for future use |
| 0x00.50BE | | CLK_PLLDIV | PLL clock divisor |
| 0x00.50BF | | CLK_AWUDIV | AWU clock divisor |
| 0x00.50C0 | | CLK_ICKR | Internal clock control |
| 0x00.50C1 | | CLK_ECKR | External clock control |
| 0x00.50C2 | | CLK_PLLR | PLL control |
| 0x00.50C3 | | CLK_CMSR | Clock master |
| 0x00.50C4 | | CLK_SWR | Clock switch |
| 0x00.50C5 | | CLK_SWCR | Switch control |
| 0x00.50C6 | | CLK_CKDIVR | Clock dividers |
| 0x00.50C7 | | CLK_PCKENR1 | Peripherals clock enable |
| 0x00.50C8 | | CLK_CSSR | Clock security system |
| 0x00.50C9 | | CLK_CCOR | Configurable clock output |
| 0x00.50CA | | CLK_PCKENR2 | Peripherals clock enable |
| 0x00.50CB | | RFU | Reserved for future use |
| 0x00.50CC | | CLK_HSITRIMR | HSI calibration trimmer |
| 0x00.50CD | | CLK_SWIMCCR | SWIM clock division |
| 0x00.50CE | | CLK_CCODIVR | CCO divider |
| 0x00.50CF | | CLK_ADCR | ADC clock configuration |

8.2.7 WWDG timers

Table 21. WWDG timer register map

| Address | Block | Register name | Register description |
|-----------|-------|---------------|----------------------|
| 0x00.50D1 | WWDG | WWDG_CR | Watchdog control |
| 0x00.50D2 | | WWDG_WR | Watchdog window |

8.2.8 IWDG timers

Table 22. IWDG timer register map

| Address | Block | Register name | Register description |
|-----------|-------|---------------|-------------------------------------|
| 0x00.50E0 | IWDG | IWDG_KR | Watchdog key |
| 0x00.50E1 | | IWDG_PR | Watchdog time base |
| 0x00.50E2 | | IWDG_RLR | Watchdog counter value after reload |

8.2.9 AWU timers

Table 23. AWU timer register map

| Address | Block | Register name | Register description |
|-----------|-------|---------------|-----------------------------------|
| 0x00.50F0 | AWU | AWU_CSR | AWU control status |
| 0x00.50F1 | | AWU_APR | AWU asynchronous prescaler buffer |
| 0x00.50F2 | | AWU_TBR | AWU time base selection |

8.2.10 Inter-integrated circuit interface (I²C)

Table 24. I²C register map

| Address | Block | Register name | Register description |
|-----------|------------------|-------------------------|--|
| 0x00.5210 | I ² C | I ² C_CR1 | I ² C control register 1 |
| 0x00.5211 | | I ² C_CR2 | I ² C control register 2 |
| 0x00.5212 | | I ² C_FREQR | I ² C frequency register |
| 0x00.5213 | | I ² C_OARL | I ² C own add-low register |
| 0x00.5214 | | I ² C_OARH | I ² C own add-high register |
| 0x00.5215 | | RFU | Reserved for future use |
| 0x00.5216 | | I ² C_DR | I ² C data register |
| 0x00.5217 | | I ² C_SR1 | I ² C status register 1 |
| 0x00.5218 | | I ² C_SR2 | I ² C status register 2 |
| 0x00.5219 | | I ² C_SR3 | I ² C status register 3 |
| 0x00.521A | | I ² C_ITR | I ² C interrupt |
| 0x00.521B | | I ² C_CCRL | I ² C clock control |
| 0x00.521C | | I ² C_CCRH | I ² C clock control |
| 0x00.521D | | I ² C_TRISER | I ² C rising edge |

8.2.11 Universal asynchronous receiver/transmitter (UART)

Table 25. UART register map

| Address | Block | Register name | Register description |
|-----------|-------|---------------|---|
| 0x00.5230 | UART | UART_SR | UART status |
| 0x00.5231 | | UART_DR | UART data |
| 0x00.5232 | | UART_BRR1 | UART baud rate div mantissa [7:0] |
| 0x00.5233 | | UART_BRR2 | UART baud rate div mantissa [11:8] SCIDIV FRACT [3:0] |
| 0x00.5234 | | UART_CR1 | UART control register 1 |
| 0x00.5235 | | UART_CR2 | UART control register 2 |
| 0x00.5236 | | UART_CR3 | UART control register 3 |
| 0x00.5237 | | UART_CR4 | UART control register 4 |

8.2.12 System timer registers

Table 26. System timer register map

| Address | Block | Register name | Register description |
|-----------|-------|---------------|----------------------|
| 0x00.5340 | STMR | STMR_CR1 | Control register 1 |
| 0x00.5341 | | STMR_IER | Interrupt enable |
| 0x00.5342 | | STMR_SR1 | Status register 1 |
| 0x00.5343 | | STMR_EGR | Event generation |
| 0x00.5344 | | STMR_CNTH | Counter high |
| 0x00.5345 | | STMR_CNTL | Counter low |
| 0x00.5346 | | STMR_PSCL | Prescaler low |
| 0x00.5347 | | STMR_ARRH | Autoreload high |
| 0x00.5348 | | STMR_ARRL | Autoreload low |

8.2.13 Auxiliary timer registers

Table 27. Auxiliary timer register map

| Address | Block | Register name | Register description |
|-----------|-------|---------------|---------------------------|
| 0x00.5009 | GPIO1 | P1CR2 | Control register 2 |
| 0x00.5036 | MSC | MSC_CFGP15 | P15 input line control |
| 0x00.5037 | | MSC_STSP1 | Port 1 status |
| 0x00.50C6 | CKC | CLK_CCODIVR | CCO clock dividers |
| 0x00.50C9 | | CLK_CCOR | Configurable clock output |

8.2.14 Basic timer0 registers

Table 28. Basic timer0 register map

| Address | Offset | Block | Register name | Register description |
|-----------|--------|-------------------|---------------|------------------------------------|
| 0x00.5031 | N.A. | MSC | MSC_CFGP10 | P10 input line control |
| 0x00.5037 | N.A. | | MSC_STSP1 | Port 1 status |
| 0x00.503C | 0x00 | MSC (indirect) | MSC_FTM0CKSEL | Basic timer source clock selection |
| 0x00.503C | 0x01 | | MSC_FTM0CKDIV | Basic Timer0 clock prescaler |
| 0x00.503C | 0x02 | | MSC_FTM0CONF | Basic Timer0 counter value |

8.2.15 Basic timer1 registers

Table 29. Basic timer1 register map

| Address | Offset | Block | Register name | Register description |
|-----------|--------|-------------------|---------------|------------------------------------|
| 0x00.5032 | N.A. | MSC | MSC_CFGP11 | P11 input line control |
| 0x00.5037 | N.A. | | MSC_STSP1 | Port 1 status |
| 0x00.503C | 0x00 | MSC (indirect) | MSC_FTM0CKSEL | Basic timer source clock selection |
| 0x00.503C | 0x03 | | MSC_FTM1CKDIV | Basic Timer1 clock prescaler |
| 0x00.503C | 0x04 | | MSC_FTM1CONF | Basic Timer1 counter value |

8.2.16 Digital addressable lighting interface (DALI)

Table 30. DALI register map

| Address | Block | Register name | Register description |
|-----------|-------|---------------|-------------------------------|
| 0x00.53C0 | DALI | DALI_CLK_L | Data rate control |
| 0x00.53C1 | | DALI_CLK_H | Data rate control |
| 0x00.53C2 | | DALI_FB0 | Forward message |
| 0x00.53C3 | | DALI_FB1 | Forward message |
| 0x00.53C4 | | DALI_FB2 | Forward message |
| 0x00.53C5 | | DALI_BD | Backward message |
| 0x00.53C6 | | DALI_CR | Control |
| 0x00.53C7 | | DALI_CSR | Control and status register |
| 0x00.53C8 | | DALI_CSR1 | Control and status register 1 |
| 0x00.53C9 | | DALI_REVLN | Control reverse signal line |

8.2.17 DALI noise rejection filter registers

Table 31. DALI filter register map

| Address | Offset | Block | Register name | Register description |
|-----------|--------|-------------------|---------------|-----------------------------------|
| 0x00.503C | 0x05 | MSC (indirect) | MCS_DALICKSEL | DALI clock selection |
| 0x00.503C | 0x06 | | MSC_DALICKDIV | DALI filter clock division factor |
| 0x00.503C | 0x07 | | MSC_DALICONF | DALI filter mode configuration |

8.2.18 Analog-to-digital converter (ADC)

Table 32. ADC register map and reset value

| Address | Block | Register name | Register description |
|-----------|------------|-------------------|----------------------------|
| 0x00.5400 | ADC | ADC_CFG | Configuration |
| 0x00.5401 | | ADC_SOC | Start of conversion |
| 0x00.5402 | | ADC_IER | Interrupt enable |
| 0x00.5403 | | ADC_SEQ | Sequencer |
| 0x00.5404 | | ADC_DATL_0 | Low part data 0 converted |
| 0x00.5405 | | ADC_DATH_0 | High part data 0 converted |
| 0x00.5406 | | ADC_DATL_1 | Low part data 1 converted |
| 0x00.5407 | | ADC_DATH_1 | High part data 1 converted |
| 0x00.5408 | | ADC_DATL_2 | Low part data 2 converted |
| 0x00.5409 | | ADC_DATH_2 | High part data 2 converted |
| 0x00.540A | | ADC_DATL_3 | Low part data 3 converted |
| 0x00.540B | | ADC_DATH_3 | High part data 3 converted |
| 0x00.540C | | ADC_DATL_4 | Low part data 4 converted |
| 0x00.540D | | ADC_DATH_4 | High part data 4 converted |
| 0x00.540E | | ADC_DATL_5 | Low part data 5 converted |
| 0x00.540F | | ADC_DATH_5 | High part data 5 converted |
| 0x00.5410 | | ADC_DATL_6 | Low part data 6 converted |
| 0x00.5411 | | ADC_DATH_6 | High part data 6 converted |
| 0x00.5412 | | ADC_DATL_7 | Low part data 7 converted |
| 0x00.5413 | | ADC_DATH_7 | High part data 7 converted |
| 0x00.5414 | ADC_SR | Status | |
| 0x00.5415 | ADC_DLYCNT | SOC delay counter | |

8.2.19 State machine event driven (SMEDs)

The SMED<n> address register is:

$$\text{ADD_REG} = (5500\text{h} + (40\text{h}) * n) + \text{offset}$$

where <n> is the SMED instance number 0 - 5.

Table 33. SMED register map

| Address (offset) | Block | Register name | Register description |
|------------------|---------|----------------|-----------------------|
| 0x00 | SMED<n> | SMD<n>_CTR | Control |
| 0x01 | | SMD<n>_CTR_TMR | Control time |
| 0x02 | | SMD<n>_CTR_INP | Control input |
| 0x03 | | SMD<n>_CTR_DTR | Dithering |
| 0x04 | | SMD<n>_TMR_T0L | Time T0 LSB |
| 0x05 | | SMD<n>_TMR_T0H | Time T0 MSB |
| 0x06 | | SMD<n>_TMR_T1L | Time T1 LSB |
| 0x07 | | SMD<n>_TMR_T1H | Time T1 MSB |
| 0x08 | | SMD<n>_TMR_T2L | Time T2 LSB |
| 0x09 | | SMD<n>_TMR_T2H | Time T2 MSB |
| 0x0A | | SMD<n>_TMR_T3L | Time T3 LSB |
| 0x0B | | SMD<n>_TMR_T3H | Time T3 MSB |
| 0x0C | | SMD<n>_PRM_ID0 | IDLE state parameter0 |
| 0x0D | | SMD<n>_PRM_ID1 | IDLE state parameter1 |
| 0x0E | | SMD<n>_PRM_ID2 | IDLE state parameter2 |
| 0x0F | | SMD<n>_PRM_S00 | S0 state parameter0 |
| 0x10 | | SMD<n>_PRM_S01 | S0 state parameter1 |
| 0x11 | | SMD<n>_PRM_S02 | S0 state parameter2 |
| 0x12 | | SMD<n>_PRM_S10 | S1 state parameter0 |
| 0x13 | | SMD<n>_PRM_S11 | S1 state parameter1 |
| 0x14 | | SMD<n>_PRM_S12 | S1 state parameter2 |
| 0x15 | | SMD<n>_PRM_S20 | S2 state parameter0 |
| 0x16 | | SMD<n>_PRM_S21 | S2 state parameter1 |
| 0x17 | | SMD<n>_PRM_S22 | S2 state parameter2 |
| 0x18 | | SMD<n>_PRM_S30 | S3 state parameter0 |
| 0x19 | | SMD<n>_PRM_S31 | S3 state parameter1 |
| 0x1A | | SMD<n>_PRM_S32 | S3 state parameter2 |

Table 33. SMED register map (continued)

| Address (offset) | Block | Register name | Register description |
|------------------|---------|----------------|------------------------------|
| 0x1B | SMED<n> | SMD<n>_CFG | Timer configuration register |
| 0x1C | | SMD<n>_DMP_L | Counter dump LSB |
| 0x1D | | SMD<n>_DMP_H | Counter dump MSB |
| 0x1E | | SMD<n>_GSTS | General status |
| 0x1F | | SMD<n>_IRQ | Interrupt request register |
| 0x20 | | SMD<n>_IER | Interrupt enable register |
| 0x21 | | SMD<n>_ISEL | External events control |
| 0x22 | | SMD<n>_DMP | Dump enable |
| 0x23 | | SMD<n>_FSM_STS | FSM core status |

8.2.20 CPU register

Table 34. CPU register map

| Address | Block | Register name | Register description |
|-----------|-------|---------------|--------------------------|
| 0x00.7F00 | CPU | A | Accumulator |
| 0x00.7F01 | | PCE | Program counter extended |
| 0x00.7F02 | | PCH | Program counter high |
| 0x00.7F03 | | PCL | Program counter low |
| 0x00.7F04 | | XH | X - index high |
| 0x00.7F05 | | XL | X - index low |
| 0x00.7F06 | | YH | Y - index high |
| 0x00.7F07 | | YL | Y - index low |
| 0x00.7F08 | | SPH | Stack pointer high |
| 0x00.7F09 | | SPL | Stack pointer low |
| 0x00.7F0A | | CC | Code condition |

Note: Register space accessible in debug mode only.

8.2.21 Global configuration register

Table 35. CFG_GCR register map

| Address | Block | Register name | Register description |
|-----------|-------|---------------|----------------------|
| 0x00.7F60 | GCR | CFG_GCR | Global configuration |

8.2.22 Interrupt controller

Table 36. Interrupt software priority register map

| Address | Block | Register name | Register description |
|-----------|-------|---------------|----------------------------------|
| 0x00.7F70 | ITC | ITC_SPR0 | Interrupt SW priority register 0 |
| 0x00.7F71 | | ITC_SPR1 | Interrupt SW priority register 1 |
| 0x00.7F72 | | ITC_SPR2 | Interrupt SW priority register 2 |
| 0x00.7F73 | | ITC_SPR3 | Interrupt SW priority register 3 |
| 0x00.7F74 | | ITC_SPR4 | Interrupt SW priority register 4 |
| 0x00.7F75 | | ITC_SPR5 | Interrupt SW priority register 5 |
| 0x00.7F76 | | ITC_SPR6 | Interrupt SW priority register 6 |
| 0x00.7F77 | | ITC_SPR7 | Interrupt SW priority register 7 |

8.2.23 SWIM control register

Table 37. SWIM register map

| Address | Block | Register name | Register description |
|-----------|-------|---------------|-----------------------|
| 0x00.7F80 | SWIM | SWIM_CSR | SWIM control status |
| 0x00.7F90 | DM | DM_BK1E | DM internal registers |
| | | ... | |
| 0x00.7F9B | | DM_VER | |

9 Interrupt table

Table 38 shows the STNRG internal controller's interrupt.

Table 38. Interrupt vector exception

| Priority | Source block | Description | Wakeup from Halt | Wakeup from active- halt | Interrupt vector address |
|----------|--------------------|--|-------------------------|--------------------------|--------------------------|
| | RESET | Reset | Yes | Yes | 8000h |
| | TRAP | Software interrupt | | | 8004h |
| 0 | NMI | NMI (not maskable interrupt) | Yes ⁽¹⁾ | Yes ⁽¹⁾ | 8008h |
| 1 | AWU | Auto-wakeup from Halt | | Yes | 800Ch |
| 2 | CKC | Clock controller | | | 8010h |
| 3 | PO | GPIO0 [5:0] external interrupts | Yes ^{(1), (2)} | Yes ^{(1), (2)} | 8014h |
| 4 | P1 | GPIO1 [5:0], Aux/Basic timers interrupts | Yes ^{(1), (2)} | Yes ^{(1), (2)} | 8018h |

Table 38. Interrupt vector exception (continued)

| Priority | Source block | Description | Wakeup from Halt | Wakeup from active- halt | Interrupt vector address |
|----------|--------------------|---------------------|------------------|--------------------------|--------------------------|
| 28 | RFU ⁽³⁾ | Reserved future use | | | 8078h |
| 29 | RFU ⁽³⁾ | Reserved future use | | | 807Ch |

1. The P [2, 0] [x] may be configured to generate a NMI requests.
2. The P [3, 0] [x] may be configured to generate an IRQ requests.
3. All RFU and unused interrupts should be initialized with 'IRET' for robust programming.
4. The P0 [x] may be configured to generate an IRQ and NMI request.

10 Option bytes

The user option byte is a memory E²PROM area allowing users to customize the IC device major functionalities:

- ROP: read-out protection control field
- UBC: user boot code protection
- PWM: configurable reset output value
- WDG: internal watchdog HW configuration
- AFR: alternate multifunction signals configuration
- CKC: clock controller functionalities (PLL, HSE enable, AWU clock selection, etc.)
- HSE: clock stabilization counter
- WAIT: Flash and E²PROM wait state access time has to be configured with value 0x00
- BOOT: configurable internal boot sources
- BL: bootloader control sequences

Except the ROP byte all the other option bytes are stored twice in a regular (OPT) and complemented format (NOPT) for redundancy. The option byte can be programmed in ICP mode through the SWIM interface or in IAP mode by the application with the exception of the ROP byte that can be only configured via the SWIM interface.

For further information about Flash programming refer to the programming manual “How to program STM8S and STM8A Flash program memory and data EEPROM” (PM0051).

For information on SWIM programming procedures refer to the “STM8 SWIM communication protocol and debug module” user manual (UM0470).

10.1 Option byte register overview

Table 39. Option byte register overview - STNRG388A

| Address | Option name | Option bits | | | | | | | | Default settings |
|---------|-------------|---------------|------------|-----------------|-------------|-----------------|------------|---------------------|--------------|------------------|
| | | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | |

| 4817h 487Dh | RESERVED | - | - | - | - | - | - | - | - | 00h |
| 487Eh | OPTBL | BL [7:0] | | | | | | | | 00h |
| 487Fh | nOPTBL | nBL [7:0] | | | | | | | | FFh |

Note: *The default setting values refer to the factory configuration. The factory configuration can be overwritten by the user in accordance with the target application requirements.*

The factory configuration values are loosed after user programming fields or in case of the ROP unprotecting attempt causing a “Global Flash Erase”.

The predefined initialized bit-values (1 or 0) must be preserved during memory writing.

An undefined option bit must be keep 0 and the complement value at 1 during the memory writing sequence.

10.2 Option byte register description

The option byte registers are mapped inside the E²PROM data region.

10.2.1 ROP (memory read-out protection register)

Table 40. ROP (memory read-out protection register)

| | | | | | | | |
|----------------------------|---|---|---|---|---|---|---|
| Offset: 0x004800 | | | | | | | |
| Default value: 0x00 | | | | | | | |
| 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| ROP [7:0] | | | | | | | |
| r/w | | | | | | | |

Bit 7 - 0:

ROP [7:0] memory read-out protection:

0xAA: enable read-out protection. When read-out protection is enabled, reading or modifying the Flash program memory and DATA area in ICP mode (using the SWIM interface) is forbidden, whatever the write protection settings are.

10.2.2 UBC (UBC user boot code register)

Table 41. UBC (UBC user boot code register)

| | | | | | | | |
|----------------------------|---|---|---|---|---|---|---|
| Offset: 0x004801 | | | | | | | |
| Default value: 0x00 | | | | | | | |
| 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| UBC [7:0] | | | | | | | |
| r/w | | | | | | | |

Bit 7 - 0:

UBC [7:0] user boot code write protection memory size: 0x00: no UBC, no Flash memory write-protection

0x01: pages 0 to 1 defined as UBC; 1 Kbyte memory write-protected (0x00.8000-0x00.83FF)

0x02: pages 0 to 3 defined as UBC; 2 Kbyte memory write-protected (0x00.8000-0x00.87FF)

0x03: pages 0 to 4 defined as UBC; 2.5 Kbyte memory write-protected (0x00.8000-0x00.89FF)

... (512 byte every page)

0x3E: pages 0 to 63 defined as UBC; 32 Kbyte memory write-protected (0x00.8000-0x00.FFFF)

Other values: reserved.

10.2.3 nUBC (UBC user boot code register protection)

Table 42. nUBC (UBC user boot code register protection)

| Offset: 0x004802 | | | | | | | |
|---------------------|---|---|---|---|---|---|---|
| Default value: 0xFF | | | | | | | |
| 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| nUBC [7:0] | | | | | | | |
| r/w | | | | | | | |

nUBC: not (UBC) EMC byte protection.

10.2.4 GENCFG (general configuration register)

Table 43. GENCFG (general configuration register)

| Offset: 0x004803 | | | | | | | |
|---------------------|---|---|---|---|---|-----|-------------|
| Default value: 0x00 | | | | | | | |
| 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Rst_PWM [5:0] | | | | | | RFU | EN_COLD_CFG |
| r/w | | | | | | r | r/w |

Bit 0:

The EN_COLD_CFG enables IC cold configuration through the option byte register AFR_IOMXP0, P1 and P2:

0: default case, the IC multifunction signal configuration is performed by the miscellaneous registers MSC_IOMXP0, MSC_IOMXP1 and MSC_IOMXP2 (warm configuration).

1: enables the multifunction signal configuration through the option byte registers AFR_IOMXP0, AFR_IOMXP1 and AFR_IOMXP2 (cold configuration).

Bit 1:

RFU reserved; must be kept 0 during register writing for future compatibility

Bit 7:2:

Rst_PWM [5:0] configures the PWM [n] reset value after the NRST signal

0: PWM [n] output low level (native default value)

1: PWM [n] output high level.

Note: The PWM signal programmed reset value is configured during the option byte loader phase, then before the NRST is released it assumes its proper initial values.

10.2.5 nGENCFG (general configuration register protection)

Table 44. nGENCFG (general configuration register protection)

| Offset: 0x004804 | | | | | | | |
|---------------------|---|---|---|---|---|------|--------------|
| Default value: 0xFF | | | | | | | |
| 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| nRst_PWM [5:0] | | | | | | nRFU | nEN_COLD_CFG |
| r/w | | | | | | r | r/w |

nGENCFG: not (GENCFG) EMC byte protection

10.2.6 MISCUOPT (miscellaneous configuration register)

Table 45. MISCUOPT (miscellaneous configuration register)

| Offset: 0x004805 | | | | | | | |
|---|-----|-----|-----|--------|---------|---------|-----------|
| Default value: 0x28 (factory configuration) | | | | | | | |
| 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RFU | RFU | RFU | RFU | LSI_EN | IWdg_hw | WWdg_hw | WWdg_HALT |
| r | r | r | r | r/w | r/w | r/w | r/w |

Bit 0:

WWdg_HALT window watchdog reset on Halt:

0: no reset generated on Halt if WWDG is active

1: reset generated on Halt if WWDG is active.

Bit 1:

WWdg_hw window watchdog hardware enable:

0: window watchdog activation by SW

1: window watchdog activation by HW.

Bit 2:

IWdg_hw independent watchdog hardware enable:

0: independent watchdog activation by SW

1: independent watchdog activation by HW.

Bit 3:

LSI_EN low speed internal RCOSC clock enable:

0: LSI clock is not available to CPU

1: LSI clock is enabled for CPU.

Bit 4:

RFU reserved; must be kept 0 during register writing for future compatibility.

Bit 5:

RFU reserved; must be kept 1 during register writing for future compatibility.

Bit 7 - 6:

RFU reserved; must be kept 0 during register writing for future compatibility.

10.2.7 nMISCUOPT (miscellaneous configuration register protection)

Table 46. nMISCUOPT (miscellaneous configuration register protection)

| Offset: 0x004806 | | | | | | | |
|---|------|------|---------|----------|----------|------------|-----|
| Default value: 0xD7 (factory configuration) | | | | | | | |
| 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| nRFU | nRFU | nRFU | nLSI_EN | nIWdg_hw | nWWdg_hw | nWWdg_HALT | |
| r | r | r | r/w | r/w | r/w | r/w | r/w |

nMISCUOPT: not (MISCUOPT) EMC byte protection

10.2.8 CLKCTL (CKC configuration register)

Table 47. CLKCTL (CKC configuration register)

| Offset: 0x004807 | | | | | | | |
|---|-----|-----------|-----------|--------|-----------|------------|---|
| Default value: 0x89 (factory configuration) | | | | | | | |
| 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| PWM_OD | RFU | SMD_HWtrg | CKAWUSEL1 | EXTCLK | CKAWUSEL0 | PRSC [1:0] | |
| r/w | r | r/w | r/w | r/w | r/w | r/w | |

Bit 1 - 0:

PRSC [1:0] prescaler value for HSE to provide AWU unit with the low speed clock:

00: 24 MHz to 128 kHz prescaler

01: 16 MHz to 128 kHz prescaler

10: 8 MHz to 128 kHz prescaler

11: 4 MHz to 128 kHz prescaler.

Bit 3:

EXTCLK external clock selection:

0: external crystal oscillator clock connected to HseOscin and HseOscout signals

1: external direct drive clock connected to HseOscin.

Bit 4, 2:

CKAWUSEL [1:0] AWU clock selection:

00: low speed internal clock used for AWU module

01: HSE high speed external clock with prescaler used for AWU module

10: reserved encoding value

11: reserved encoding value.

Bit 5:

SMD_HWtrg enable SMED ADC HW trigger functionality:

0: disable SMED ADC HW trigger request

1: enable SMED ADC HW trigger request; this functionality requires that all SMEDs must be configured with $f_{SMED} \geq f_{MASTER}$ and the ADC_HWtrg option bit of the AFR_IOMXP2 register programmed at '0'.

Bit 6:

RFU reserved; must be kept 0 during register writing for future compatibility.

Bit 7:

PWM_OD PWM output pseudo- open drain features:

0: enable PWM output signal open drain. This functionality is configurable by GPIO1 internal registers.

1: disable PWM output signal open drain functionality.

10.2.9 nCLKCTL (CKC configuration register protection)

Table 48. nCLKCTL (CKC configuration register protection)

| | | | | | | | |
|---|------|------------|------------|---------|------------|-------------|---|
| Offset: 0x004808 | | | | | | | |
| Default value: 0x76 (factory configuration) | | | | | | | |
| 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| nPWM_OD | nRFU | nSMD_HWtrg | nCKAWUSEL1 | nEXTCLK | nCKAWUSEL0 | nPRSC [1:0] | |
| r/w | r | r/w | r/w | r/w | r/w | r/w | |

nCLKCTL: not (CLKCTL) EMC byte protection.

10.2.10 HSESTAB (HSE clock stabilization register)

Table 49. HSESTAB (HSE clock stabilization register)

| | | | | | | | |
|---------------------|---|---|---|---|---|---|---|
| Offset: 0x004809 | | | | | | | |
| Default value: 0x00 | | | | | | | |
| 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| HSECNT [7:0] | | | | | | | |
| r/w | | | | | | | |

Bit 7 - 0:

HSECNT [7:0] HSE crystal oscillator stabilization cycles:

0x00: 2048 clock cycles

0xB4: 128 clock cycles

0xD2: 8 clock cycles

0xE1: 0.5 clock cycles.

10.2.11 nHSESTAB (HSE clock stabilization register protection)

Table 50. nHSESTAB (HSE clock stabilization register protection)

| | | | | | | | |
|---------------------|---|---|---|---|---|---|---|
| Offset: 0x00480A | | | | | | | |
| Default value: 0xFF | | | | | | | |
| 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| nHSECNT [7:0] | | | | | | | |
| r/w | | | | | | | |

nHSESTAB: not (HSESTAB) EMC byte protection.

10.2.12 ENHFEAT (EXP features configuration register)

Table 51. ENHFEAT (EXP features configuration register)

| | | | | | | | |
|---------------------|---------|------------|---------|-----|---|---|---|
| Offset: 0x00480B | | | | | | | |
| Default value: 0x00 | | | | | | | |
| 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RFU | BscTim1 | ADC_MFlush | BscTim0 | RFU | | | |
| r | r/w | r/w | r/w | r | | | |

Bit 0 - 3:

RFU reserved; must be kept 0 during register writing for future compatibility.

Bit 4:

BscTim0 enable basic Timer0:

0: enable basic Timer0

1: disable basic Timer0.

Bit 5:

ADC_MFlush enable ADC mode flush:

0: enable ADC mode flush

1: disable ADC mode flush.

Bit 6:

BscTim1 enable basic Timer1:

0:enable basic Timer0

1: disable basic Timer0.

Bit 7:

RFU reserved; must be kept 0 during register writing for future compatibility.

10.2.13 nENHFEAT (EXP features configuration register)

Table 52. nENHFEAT (EXP features configuration protection)

| Offset: 0x00480C | | | | | | | |
|---------------------|----------|-------------|----------|------|---|---|---|
| Default value: 0xFF | | | | | | | |
| 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| nRFU | nBscTim1 | nADC_MFlush | nBscTim0 | nRFU | | | |
| r | r/w | r/w | r/w | r | | | |

nENHFEAT: not (ENHFEAT) EMC byte protection.

10.2.14 WAITSTATE (Flash wait state register)

Table 53. WAITSTATE (Flash wait state register)

| Offset: 0x00480D | | | | | | | |
|---------------------|----------|-----|------------|-----|-----------|---------------|---|
| Default value: 0x00 | | | | | | | |
| 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RFU | ADC_NAht | RFU | ADC_AFlush | RFU | ADC_ARlod | WaitStat[1:0] | |
| r | r/w | r | r/w | r | r/w | r/w | |

Bit 1 - 0:

WaitStat [1:0] configures the E²PROM and Flash programmable delay read access time:

00: 0 no delay cycle (default case f_{MASTER} at 16 MHz)

01: 1 delay cycles

10: 2 delay cycles

11: 3 delay cycles.

Bit 2:

ADC_ARlodenable ADC auto-reload conversion command:

0: enable ADC auto-reload conversion command

1: disable ADC auto-reload conversion command

Bit 3:

RFU reserved; must be kept 0 during register writing for future compatibility.

Bit 4:

ADC_AFlush enable ADC auto-flush:
 0: enable ADC auto-flush command
 1: disable ADC auto-flush command

Bit 5:

RFU reserved; must be kept 0 during register writing for future compatibility.

Bit 6:

ADC_NAAbt enable ADC new abort mode:
 0: enable ADC new abort/flush mode
 1: disable ADC new abort/flush mode (ADC abort/flush sequence compliant with the STLUXxxxxA family).

Bit 7:

RFU reserved; must be kept 0 during register writing for future compatibility.

10.2.15 nWAITSTATE (Flash wait state register protection)

Table 54. nWAITSTATE (Flash wait state protection)

| | | | | | | | |
|----------------------------|------------|------|-------------|------|------------|-----------------|---|
| Offset: 0x00480E | | | | | | | |
| Default value: 0xFF | | | | | | | |
| 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| nRFU | nADC_NAAbt | nRFU | nADC_AFlush | nRFU | nADC_ARlOd | nWaitStat [1:0] | |
| r | r/w | r | r/w | r | r/w | r/w | |

nWAITSTATE: not (WAITSTATE) EMC byte protection.

10.2.16 AFR_IOMXP0 (alternative Port0 configuration register)

Table 55. AFR_IOMXP0 (alternative Port0 configuration register)

| | | | | | | | |
|----------------------------|---|----------------|---|----------------|---|-------------------------------|---|
| Offset: 0x00480F | | | | | | | |
| Default value: 0x00 | | | | | | | |
| 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RFU | | Sel_P054 [1:0] | | Sel_P032 [1:0] | | Sel_P010 [1:0] ⁽¹⁾ | |
| r | | r/w | | r/w | | r/w | |

1. Available only on the STNRG388A, otherwise keep 0.

Bit 5 - 0:

Refer to MSC_IOMXP0 miscellaneous register field description in [Section 7.6 on page 42](#).

Bit 7 - 6:

RFU reserved; must be kept 0 during register writing for future compatibility.

10.2.17 nAFR_IOMXP0 (alternative Port0 configuration register protection)

Table 56. nAFR_IOMXP0 (alternative Port0 configuration register protection)

| Offset: 0x004810 | | | | | | | |
|---------------------|---|-----------------|---|-----------------|---|-----------------|---|
| Default value: 0xFF | | | | | | | |
| 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| nRFU | | nSel_P054 [1:0] | | nSel_P032 [1:0] | | nSel_P010 [1:0] | |
| r | | r/w | | r/w | | r/w | |

nAFR_IOMXP0: not (AFR_IOMXP0) EMC byte protection.

10.2.18 AFR_IOMXP1 (alternative Port1 configuration register)

Table 57. AFR_IOMXP1 (alternative Port1 configuration register)

| Offset: 0x004811 | | | | | | | |
|--|-----|---------|---------|---------|---------|---------|---------|
| Default value: 0x3F, 0x1F or 0F depends of devices | | | | | | | |
| 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| AUXTIM | RFU | Sel_p15 | Sel_p14 | Sel_p13 | Sel_p12 | Sel_p11 | Sel_p10 |
| r/w | r | r/w | r/w | r/w | r/w | r/w | r/w |

Bit 5 - 0:

Refer to MSC_IOMXP1 miscellaneous register field description in [Section 7.6 on page 42](#).

Bit 6:

RFU reserved; must be kept 0 during register writing for future product compatibility.

Bit 7:

AUXTIM CCO aux timer compatibility features

0: CCOaux timer enabled

1: CCOaux timer disabled.

10.2.19 nAFR_IOMUXP1 (alternative Port1 configuration register protection)

10.2.22 MSC_OPT0 (miscellaneous configuration reg0)

Table 61. MSC_OPT0 (miscellaneous configuration reg0)

| Offset: 0x004815 | | | | | | | |
|---------------------|---|----------------|---|-----|---|---------------|---|
| Default value: 0x01 | | | | | | | |
| 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RFU | | UARTline [1:0] | | RFU | | BootSel [1:0] | |
| r | | r/w | | r | | r/w | |

Bit 1 - 0:

BootSel [1:0] boot-ROM peripheral enables:

00: automatic scan boot sources; this selection enables the automatic scan configuration sequence of all possible initializing peripheral devices: Periph0 (UART), Periph1 (RFU).

01: enable boot source: Periph0

10: enable boot source: Periph1

11: enable boot sources: Periph1, Periph0

Bit 2 - 3:

RFU reserved; must be kept 0 during register writing for future compatibility.

Bit 5 - 4:

UARTline [1:0] selects the UART port configuration pins involved during the bootloader sequence in warm configuration mode; in case of cold configuration, this field is ignored since the UART port is selected by the register AFR_IOXP0.

00: boot sequence with UART i/f configured in all possible UART multiplexed signal schemes. This sequence is used when the UART i/f position is not specified.

01: boot sequence with UART i/f configured on P0 (1, 0) available only on the STNRG388A.

10: boot sequence with UART i/f configured on P0 (3, 2)

11: boot sequence with UART i/f configured on P0 (5, 4).

Bit 7 - 6:

RFU reserved; must be kept 0 during register writing for future compatibility.

10.2.23 nMSC_OPT0 (miscellaneous configuration reg0 protection)

Table 62. nMSC_OPT0 (miscellaneous configuration reg0 protection)

| Offset: 0x004816 | | | | | | | |

| nBL [7:0] | | | | | | | |
| r/w | | | | | | | |

nOPTBL: not (OPTBL) EMC byte protection.

11 Device identification

11.1 Unique ID

The STNRG family provides a 56-bit unique identifier code usable as a device identification number which can be used to increase the device security. The unique ID code is a frozen signature not alterable by the user.

The unique device identifier is ideally used by the application software and is suited for:

- Serial code
- Security keys in conjunction with cryptographic software to increase the embedded Flash code security
- Activating the secure boot sequence.

Table 65. Unique ID register overview

| Address | Option name | Unique ID bits | | | | | | | |
|---------|-------------|----------------|---|---|---|----------------|---|---|---|
| | | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| 48E0h | UID0 | LotNum [7:0] | | | | | | | |
| 48E1h | UID1 | LotNum [15:8] | | | | | | | |
| 48E2h | UID2 | LotNum [23:16] | | | | | | | |
| 48E3h | UID3 | WaferNum [4:0] | | | | Xcoord [7:5] | | | |
| 48E4h | UID4 | Xcoord [4:0] | | | | Ycoord [7:5] | | | |
| 48E5h | UID5 | Ycoord [4:0] | | | | LotNum [42:40] | | | |
| 48E6h | UID6 | LotNum [31:24] | | | | | | | |
| 48E7h | UID7 | LotNum [39:32] | | | | | | | |

11.2 Device ID

The STNRG device identification model is coded in the following register area and it cannot be altered by the user.

Table 66. Dev ID register overview

| Address | Option name | Dev ID bits | | | | | | | | Default settings |
|---------|-------------|--------------|---|---|---------------|---|---|---|---|------------------|
| | | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | |
| 4896h | DVD0 | DEV_ID[7:0] | | | | | | | | (1) |
| 4897h | nDVD0 | nDEV_ID[7:0] | | | | | | | | (2) |
| 4898h | DVD1 | RFU | | | Rev_ID [4:0] | | | | | (1) |
| 4899h | nDVD1 | nRFU | | | nRev_ID [4:0] | | | | | (2) |

1. Refer to [Table 67](#).
2. The values are the complement of the first of the twice register.

The RFU and nRFU values are reserved and the value may be changed within devices.

Table 67. Device revision model overview

| STNRG device revision model | | |
|-----------------------------|-------------|-------------|
| DEV_ID[7:0] | Rev_ID[4:0] | Device name |
| 0x04 | 0b00001 | STNRG388A |

Note: Mask the DVD1 and nDVD1 register with 0x1F when read the Rev_ID [4:0] field.

12 Electrical characteristics

12.1 Parameter conditions

Unless otherwise specified, all voltages are referred to VSS. VDDA and VDD must be connected to the same voltage value. VSS and VSSA must be connected together with the shortest wire loop.

12.1.1 Minimum and maximum values

Unless otherwise specified, the minimum and maximum values are guaranteed in the worst conditions of ambient temperature, supply voltage and frequencies by tests in production on 100% of the devices with an ambient temperature at $T_A = 25\text{ °C}$ and $T_A = T_A\text{ max.}$ (given by the selected temperature range).

Data based on characterization results, design simulation and/or technology characteristics are indicated according to each table specific notes and are not tested in production.

12.1.2 Typical values

Unless otherwise specified, typical data are based on $T_A = 25\text{ °C}$, V_{DD} and $V_{DDA} = 3.3\text{ V}$. They are given only as design guidelines and are not tested. Typical ADC accuracy values are determined by characterization of a batch of samples from a standard diffusion lot over the full temperature range.

12.1.3 Typical curves

Unless otherwise specified, all typical curves are given as design guidelines only and are not tested.

12.1.4 Typical current consumption

For typical current consumption measurements, V_{DD} and V_{DDA} are connected together as shown in [Figure 9](#).

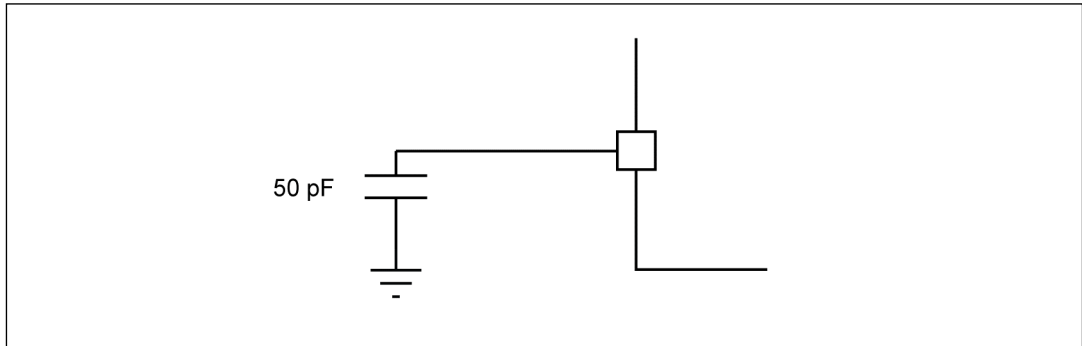

Figure 9. Supply current measurement conditions

12.1.5 Loading capacitors

The loading conditions used for pin parameter measurement are shown in *Figure 10*:

Figure 10. Pin loading conditions

12.1.6 Pin output voltage

The input voltage measurement on a pin is described in *Figure 11*.

Figure 11. Pin input voltage

12.2 Absolute maximum ratings

Stresses above those listed as 'absolute maximum ratings' may cause permanent damage to the device. This is a stress rating only and functional operation of the device under these conditions is not implied. Exposure to maximum rating conditions for extended periods may affect the device reliability.

Table 68. Voltage characteristics

| Symbol | Ratings | Min. | Max. | Unit |
|---------------------|--|--|----------------|------|
| $V_{DDX} - V_{SSX}$ | Supply voltage ⁽¹⁾ | -0.3 | 6.5 | V |
| V_{IN} | Input voltage on any other pin ⁽²⁾ | $V_{SS} - 0.3$ | $V_{DD} + 0.3$ | |
| $V_{DD} - V_{DDA}$ | Variation between different power pins | | 50 | mV |
| $V_{SS} - V_{SSA}$ | Variation between all the different ground pins ⁽³⁾ | | 50 | |
| V_{ESD} | Electrostatic discharge voltage | Refer to absolute maximum ratings (electrical sensitivity) in Section 12.4.1 on page 116 | | |

1. All power V_{DDX} (V_{DD} , V_{DDA}) and ground V_{SSX} (V_{SS} , V_{SSA}) pins must always be connected to the external power supply.
2. $I_{INJ(PIN)}$ must never be exceeded. This is implicitly insured if V_{IN} maximum is respected. If V_{IN} maximum cannot be respected, the injection current must be limited externally to the $I_{INJ(PIN)}$ value. A positive injection is induced by $V_{IN} > V_{DD}$ while a negative injection is induced by $V_{IN} < V_{SS}$.
3. V_{SS} and V_{SSA} signals must be interconnected together with a short wire loop.

Table 69. Current characteristics

| Symbol | Ratings | Max. ⁽¹⁾ | Unit |
|---|--|--|------|
| I_{VDDX} | Total current into VDDX power lines ⁽²⁾ | 100 | mA |
| I_{VSSX} | Total current out of VSSX power lines ⁽²⁾ | 100 | |
| I_{IO} | Output current sunk by any I/Os and control pin | Ref. to Table 84 on page 100 | |
| | Output current source by any I/Os and control pin | | |
| $I_{INJ(PIN)}$ ^{(3), (4)} | Injected current on any pin | ± 4 | |
| $I_{INJ(TOT)}$ ^{(3), (4), (5)} | Sum of injected currents | ± 20 | |

1. Data based on characterization results, not tested in production.
2. All power V_{DDX} (V_{DD} , V_{DDA}) and ground V_{SSX} (V_{SS} , V_{SSA}) pins must always be connected to the external power supply.
3. $I_{INJ(PIN)}$ must never be exceeded. This is implicitly insured if V_{IN} maximum is respected. If V_{IN} maximum cannot be respected, the injection current must be limited externally to the $I_{INJ(PIN)}$ value. A positive injection is induced by $V_{IN} > V_{DD}$ while a negative injection is induced by $V_{IN} < V_{SS}$.
4. Negative injection disturbs the analog performance of the device.
5. When several inputs are submitted to a current injection, the maximum $I_{INJ(PIN)}$ is the absolute sum of the positive and negative injected currents (instantaneous values). These results are based on characterization with $I_{INJ(PIN)}$ maximum current injection on four I/O port pins of the device.

Table 70. Thermal characteristics

| Symbol | Ratings | Max. | Unit |
|------------------|------------------------------|------------|------|
| T _{STG} | Storage temperature range | -65 to 150 | °C |
| T _J | Maximum junction temperature | 150 | |

12.3 Operating conditions

The device must be used in operating conditions that respect the parameters listed in [Table 71](#). In addition, a full account must be taken for all physical capacitor characteristics and tolerances.

Table 71. General operating conditions

| Symbol | Parameter | Conditions | Min. | Typ. | Max. | Unit |
|--------------------------------------|---|-------------------------------|--------------------|--------------------|--------------------|------|
| f _{CPU} | Internal CPU clock frequency | -40 ≤ T _A ≤ 105 °C | 0 | | 16 | MHz |
| V _{DD1} , V _{DDA1} | Operating voltages | | 3 ⁽¹⁾ | | 5.5 ⁽¹⁾ | V |
| V _{DD} , V _{DDA} | Nominal operating voltages | | 3.3 ⁽¹⁾ | | 5 ⁽¹⁾ | |
| V _{OUT} | Core digital power supply | | | 1.8 ⁽²⁾ | | |
| | CVOUT: capacitance of external capacitor ⁽³⁾ | at 1 MHz | 470 | | 3300 | nF |
| | ESR of external capacitor ⁽²⁾ | | 0.05 | | 0.2 | Ω |
| | ESL of external capacitor ⁽²⁾ | | | | 15 | nH |
| Θ _{JA} ⁽⁴⁾ | FR4 multilayer PCB | TSSOP38 | | 80 | | °C/W |
| T _A | Ambient temperature | P _d = 100 mW | -40 | | 105 | °C |

1. The external power supply can be within range from 3 V up to 5.5 V although IC performances are optimized for a power supply equal to 3.3 V.
2. Internal core power supply voltage.
3. Care should be taken when the capacitor is selected due to its tolerance, its dependency on temperature, DC bias and frequency.
4. To calculate P_{Dmax} (T_A), use the formula P_{Dmax} = (T_{Jmax} - T_A)/Θ_{JA}.

Table 72. Operating conditions at power-up/power-down

| Symbol | Parameter | Conditions | Min. ⁽¹⁾ | Typ. | Max. ⁽¹⁾ | Unit |
|----------------|---------------------------|-----------------|---------------------|------|--------------------------|------|
| t_{VDD} | VDD rise time rate | | 2 $\mu\text{s/V}$ | | 1 sec./ $\text{V}^{(2)}$ | |
| | VDD fall time rate | | 2 $\mu\text{s/V}$ | | 1 sec./ $\text{V}^{(2)}$ | |
| t_{TEMP} | Reset release delay | V_{DD} rising | | 3 | | ms |
| V_{IT+} | Power-on reset threshold | | 2.65 | 2.8 | 2.98 | V |
| V_{IT-} | Brownout reset threshold | | 2.58 | 2.73 | 2.88 | |
| $V_{HYS(BOR)}$ | Brownout reset hysteresis | | | 70 | | mV |

1. Guaranteed by design, not tested in production.

2. Power supply ramp must be monotone.

12.3.1 VOUT external capacitor

The stabilization of the main regulator is achieved by connecting an external capacitor $C_{VOUT}^{(c)}$ to the VOUT pin. The C_{VOUT} is specified in [Section 12.3: Operating conditions](#). Care should be taken to limit the series inductance to less than 15 nH.

Figure 12. External capacitor C_{VOUT} 

12.3.2 Supply current characteristics

The STNRG supply current is calculated by summing the supply base current in the desired operating mode as per [Table 73](#), with the peripheral supply current value reported in [Table 65 on page 79](#) and [Table 66 on page 80](#).

For example, considering an application where:

- $f_{MASTER} = f_{CPU} = 16$ MHz provided by HSI internal RC oscillator
- CPU code execution in Flash
- All base peripheral actives: I²C, UART, DALI, ITC, GPIO0, SysTmr, WWDG and IWDG
- ADC conversion frequency $f_{ADC} = 5.3$ MHz
- ACU (comparator and DAC units) active
- 6 PWM toggling at $f_{PWM} = 0.5$ MHz provided by 6 SMEDs running at $f_{SMED} = 12$ MHz ($N_{PWM} = 6$).

c. ESR is the equivalent series resistance and ESL is the equivalent inductance.

The total current consumption is given by [Equation 1](#):

Equation 1

$$I_{DD} = I_{DD(\text{Run2})} + I_{DD(\text{ADC2})} + I_{DD(\text{ACU})} + I_{DD(\text{PLL})} + I_{DD(\text{PWM})}$$

where $I_{DD(\text{PWM})} = I_{DD(\text{PWM1})} \times N_{\text{PWM}}$

More generally, the PWM current consumption is given for each fSMED clock grouping, by [Equation 2](#):

Equation 2

$$I_{DD(\text{PWM})} = \sum_{i=1}^{N_{f\text{SMED}}} \{ I_{DD[\text{PWM}(i)]} \cdot N_i \}$$

where $i = f_{\text{SMED}}$ clock group index; $N_i = \text{PWM number of the } i\text{-th clock group}$;

$N_{f\text{SMED}} = f_{\text{SMED}}$ clock group number.

IC supply base current consumption

Table 73 summarizes the current consumption measured on V_{DD}/V_{DDA} supply pins in relevant operative conditions.

Table 73. Supply base current consumption at $V_{DD}/V_{DDA} = 3.3/5$ V

| Symbol | Code area | Clock | | | Peripheral Enb/Dis | Consumption ⁽¹⁾ | | Note Description |
|-------------------------|-----------|------------------------------|-------|-------------------------|-----------------------|----------------------------|---------------------------|--------------------------|
| | | f _{MASTER} Clock | MHz | f _{CPU} MHz | | Typ. ⁽⁴⁾ mA | Max. ⁽⁴⁾ mA | |
| I _{DD} (Run1) | Flash | HSI | 2 | 2 | All | 2.3 | 2.77 | Reset exit condition |
| I _{DD} (Run2) | Flash | HSI | 16 | 16 | All | 9.4 | 11.3 | |
| I _{DD} (Run3) | RAM | HSI | 16 | 16 | All | 4.2 | 5.1 | |
| I _{DD} (Run4) | Flash | HSE ⁽⁵⁾ | 16 | 16 | All | 10.0 | 12.1 | $V_{DD}/V_{DDA} = 3.3$ V |
| | | | | | | 10.6 | 12.74 | $V_{DD}/V_{DDA} = 5$ V |
| I _{DD} (Run5) | RAM | HSE ⁽⁵⁾ 16 | 16 | 16 | All | 4.6 | 5.53 | $V_{DD}/V_{DDA} = 3.3$ V |
| | | | | | All | 5.2 | 6.63 | $V_{DD}/V_{DDA} = 5$ V |
| I _{DD} (SLOW1) | Flash | HSI | 16 | 2 | All | 3.6 | 4.33 | |
| I _{DD} (SLOW2) | RAM | HSI | 16 | 2 | All | 2.9 | 3.5 | |
| I _{DD} (SLOW3) | Flash | HSE ⁽⁵⁾ | 16 | 2 | All | 3.9 | 4.7 | $V_{DD}/V_{DDA} = 3.3$ V |
| | | | | | All | 4.5 | 5.5 | $V_{DD}/V_{DDA} = 5$ V |
| I _{DD} (SLOW4) | Flash | HSI | 16 | 0.125 | All | 2.7 | 3.3 | |
| I _{DD} (SLOW5) | Flash | HSE ⁽⁵⁾ | 16 | 0.125 | All | 3.0 | 3.7 | $V_{DD}/V_{DD} = 3.3$ V |
| | | | | | All | 3.6 | 4.4 | $V_{DD}/V_{DDA} = 5$ V |
| I _{DD} (SLOW6) | Flash | LSI | 0.153 | 0.153 | All | 1.5 | 1.9 | |
| I _{DD} (WF11) | Flash | HSI | 16 | 16 | All | 2.6 | 3.2 | |
| I _{DD} (WF12) | Flash | HSE ⁽⁵⁾ | 16 | 16 | All | 3.1 | 3.8 | $V_{DD}/V_{DDA} = 3.3$ V |
| | | | | | All | 3.8 | 5.6 | $V_{DD}/V_{DDA} = 5$ V |

1. Data based on characterization results not tested in production.
2. "All" means: I²C, UART, DALI, ITC, GPIO0, SysTmr, WWDG and IWDG peripherals active.
3. The peripheral current consumption is supplied by the V_{CORE} voltage (1.8 V).
4. Temperature operating: T_A = 25 °C.
5. HSE frequency provided by external quartz.

IC low power current consumption

Table 74 summarizes the current consumption measured on V_{DD}/V_{DDA} supply pins in power saving conditions.

Table 74. Supply low power consumption at V_{DD}/V_{DDA} = 3.3/5 V

| Symbol | Code | Clock | | Peripheral | | Consumption ⁽¹⁾ | | Note |
|------------------------|-----------|--------------------------|-----|------------------------------------|------------------------|----------------------------|--------------------------|---|
| Op. mode (2), (3) | Code area | f _{MASTER} | | E ² PROM ⁽⁴⁾ | MVRreg. ⁽⁵⁾ | Typ. ^{(6), (7)} | Max. ^{(7), (8)} | Description |
| | | Source | MHz | Enable | Enable | mA | mA | |
| I _{DD(AHLT1)} | Flash | HSI | 16 | Enable | Enable | 0.23 | 0.32 | AWU clocked by LSI |
| I _{DD(AHLT2)} | Flash | HSI | 16 | Enable | Disable | 0.085 | 0.12 | AWU clocked by LSI |
| I _{DD(AHLT3)} | Flash | HSE ^{(9), (10)} | 16 | Enable | Enable | 0.73 | 0.90 | V _{DD} /V _{DDA} = 3.3 V |
| | | | | | | 1.4 | 1.7 | V _{DD} /V _{DDA} = 5 V |
| I _{DD(AHLT4)} | Flash | HSE ^{(9), (10)} | 16 | Enable | Disable | 0.65 | 0.95 | V _{DD} /V _{DDA} = 3.3 V |
| | | | | | | 1.2 | 1.45 | V _{DD} /V _{DDA} = 5 V |
| I _{DD(HLT1)} | Flash | HSI | 16 | Enable | Disable | 0.087 | 0.13 | |
| I _{DD(HLT2)} | Flash | HSE ^{(9), (10)} | 16 | Enable | Disable | 0.075 | 0.11 | V _{DD} /V _{DDA} = 3.3 V |
| | | | | | | 0.090 | 0.15 | V _{DD} /V _{DDA} = 5 V |

1. Data based on characterization results not tested in production.
2. Active-halt op. mode: all peripherals except AWU and IWDG are disabled (clock gated).
3. HALT op. mode: all peripherals are disabled (clock gated).
4. E²PROM is considered always enabled.
5. V_{CORE} main DC voltage regulator.
6. Temperature operating: T_A = 25 °C.
7. All the analog input signals are connected to GND; the signals of the port P0, P1 and P2 are configured as input with pull-up enabled.
8. Temperature operating: T_A = 105 °C.
9. HSE frequency provided by external quartz.
10. AWU clocked by HSE source clock.

IC peripheral current consumption (3.3 V)

Table 75 summarizes the peripheral current consumption measured on V_{DD}/V_{DDA} supply pins.

Table 75. Peripheral supply current consumption at $V_{DD}/V_{DDA} = 3.3$ V

| Symbol | Clock | | | | Peripherals | | | Consumption ⁽¹⁾ | |
|---------------------|---------|------------------|-----------------|-----------------|--------------------|------------------------|--------------------|----------------------------|--------------------|
| | PLL | $f_{SMED}^{(2)}$ | $f_{PWM}^{(3)}$ | $f_{ADC}^{(4)}$ | ADC ⁽⁵⁾ | PWM ^{(6),(7)} | ACU ⁽⁸⁾ | Typ. ⁽⁹⁾ | Max ⁽⁹⁾ |
| Op. mode | Enb/dis | MHz | MHz | MHz | Enb/dis | Num | Enb/dis | mA | mA |

- Data based on characterization results not tested in production.
- SMED frequency:
 - 96 MHz and 6 MHz frequencies require the PLL enabled.
 - Current table shows only a subset value of possible SMED frequencies.
- PWM frequency:
 - PWM toggle frequency is considered fixed to 500 kHz, close to the maximum applicative value.
- ADC frequency:
 - 6 MHz frequency requires the PLL enabled.
 - Current table shows only a subset value of possible ADC frequencies
- ADC configured in circular mode.
- Number of active PWMs.
- PWM pins are loaded with a CL (load capacitance) of 50 pF.
- If enabled all DACs and comparator units are active.
- Temperature operating: $T_A = 25\text{ °C}$

IC peripheral current consumption (5 V)

Table 76 summarizes the peripheral current consumption measured on V_{DD}/V_{DDA} supply pins.

8. If enabled all DACs and comparator units are active.
9. Temperature operating: T_A = 25 °C.

PWM current consumption overview

From *Figure 13* to *Figure 16* provide an outline view of PWM current consumption results. The consumptions are evaluated considering the maximum current at $T_A = 25\text{ }^\circ\text{C}$ with different SMED operating frequencies. The charts summarize the measurements carried out from *Table 75* and *Table 76* allowing users to derive the PWM current consumption values.

Figure 13. PWM current consumption with $f_{SMED} = PLL\ f_{PWM} = 0.5\text{ MHz}$ at $V_{DD}/V_{DDA} = 3.3\text{ V}$

Figure 14. PWM current consumption with $f_{SMED} = PLL\ f_{PWM} = 0.5\text{ MHz}$ at $V_{DD}/V_{DDA} = 5\text{ V}$

Figure 15. PWM current consumption with $f_{SMED} = HSI f_{PWM} = 0.5 \text{ MHz}$
at $V_{DD}/V_{DDA} = 3.3 \text{ V}$

Figure 16. PWM current consumption with $f_{SMED} = HSI f_{PWM} = 0.5 \text{ MHz}$
at $V_{DD}/V_{DDA} = 5 \text{ V}$

12.3.3 Low power mode wake-up time

Table 77 shows the wakeup time to resume the normal operating mode from different low power state.

Table 77. Wake-up times

| Symbol | Parameter | Conditions | | Typ. ⁽¹⁾ | Max. ⁽¹⁾ | Unit | |
|---------------|--|--|--|---------------------|---------------------|---------|--|
| $t_{WU(WFI)}$ | Wake-up time from wait mode to run mode ⁽²⁾ | $f_{CPU} \neq f_{MASTER} = 0$ to 16 MHz | | | Ref. ⁽³⁾ | μs | |
| | | $f_{CPU} = f_{MASTER} = 16$ MHz | | 0.56 | | | |
| $t_{WU(AH)}$ | Wake-up time active halt mode to run mode ⁽²⁾ | MVR voltage regulator on ⁽⁴⁾ | Flash in operating mode ⁽⁵⁾ | HSI (after wake-up) | 4 ⁽⁶⁾ | | |
| | | | Flash in power- down mode ⁽⁵⁾ | | 6 ⁽⁶⁾ | | |
| | | MVR voltage regulator off ⁽⁴⁾ | Flash in operating mode ⁽⁵⁾ | | 47 ⁽⁶⁾ | | |
| | | | Flash in power- down mode ⁽⁵⁾ | | 49 ⁽⁶⁾ | | |
| $t_{WU(H)}$ | Wake-up time from halt mode to run mode ⁽²⁾ | Flash in operating mode ⁽⁵⁾ | | 51 | | | |
| | | Flash in power-down mode ⁽⁵⁾ | | 53 | | | |

1. Data based on characterization results, not tested in production.
2. Measured from the interrupt event to the interrupt vector fetch.
3. $t_{WU(WFI)} = 2 \times 1/f_{MASTER} + 7 \times 1/f_{CPU}$.
4. Configured by the REGAH bit in the CLK_ICR register.
5. Configured by the AHALT bit in the FLASH_CR1 register.
6. Plus 1 LSI clock depending on synchronization ($f_{LSI} = 153.6$ kHz).

12.3.4 External clock sources and timing characteristics

HSE user external clock

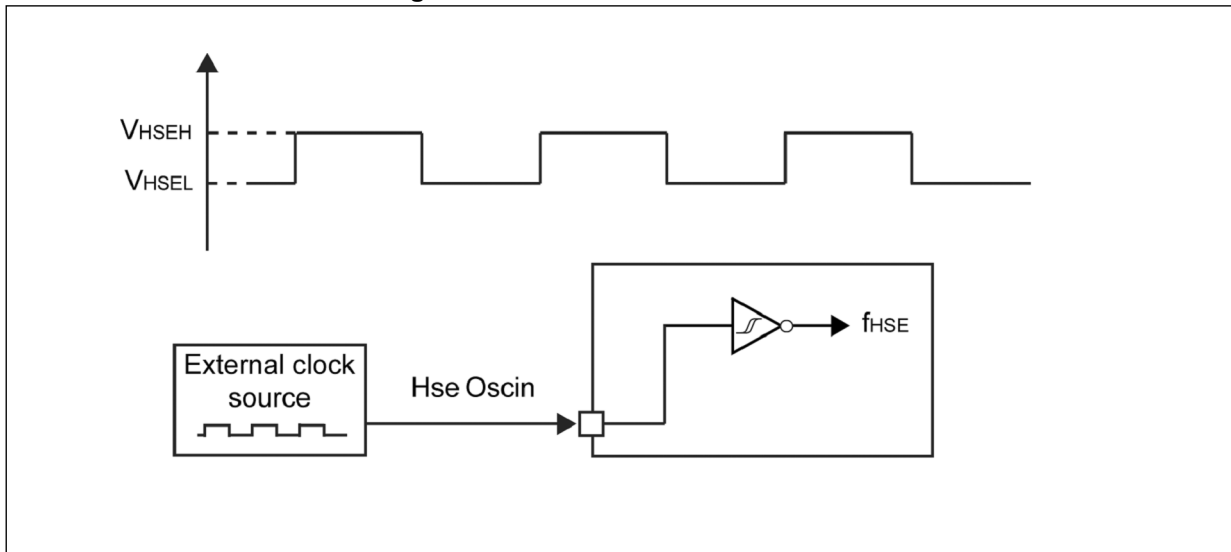

Subject to general operating conditions for V_{DD} and T_A .

Table 78. HSE user external clock characteristics

| Symbol | Parameter | Conditions | Min. | Max. | Unit |
|------------------------------|---------------------------------------|---|---------------------|---------------------|---------|
| f_{HSE_ext} | User external clock source frequency | $-40\text{ °C} \leq T_A \leq 105\text{ °C}$ | 0 | 16 ⁽¹⁾ | MHz |
| V_{HSEH} ⁽²⁾ | HSEOSCIN input pin high level voltage | | $0.7 \times V_{DD}$ | V_{DD} | V |
| V_{HSEL} ⁽²⁾ | HSEOSCIN input pin low level voltage | | V_{SS} | $0.3 \times V_{DD}$ | |
| $I_{LEAKHSE}$ ⁽²⁾ | HSEOSCIN input pin leakage | $V_{SS} \leq V_{IN} \leq V_{DD}$ | -1 | +1 | μA |

1. In case fHSE is configured as a direct clock for the SMED logics the maximum frequency can be 24 MHz.
2. Data based on characterization results, not tested in production.

Figure 17. HSE external clock source

HSE crystal/ceramic resonator oscillator

The HSE clock can be supplied with a 1 to 24 MHz crystal/ceramic resonator oscillator. All the information given in this paragraph is based on characterization results with specified typical external components. In the application, the resonator and the load capacitors have to be placed as close as possible to the oscillator pins in order to minimize output distortion and start-up stabilization time. Refer to the crystal resonator manufacturer for more details (frequency, package, accuracy, etc.).

Table 79. HSE crystal/ceramic resonator oscillator

| Symbol | Parameter | Conditions | Min. | Typ. | Max. | Unit |
|--|---|-------------------------------|------|------|----------------------------|------|
| f _{HSE} | External high speed oscillator frequency | | 1 | | 16 ⁽¹⁾ | MHz |
| R _F | Feedback resistor | | | 220 | | kΩ |
| C _{L1} , C _{L2} ⁽²⁾ | Recommended load capacitance ⁽³⁾ | | | | 20 | pF |
| I _{DD(HSE)} | HSE oscillator power consumption | | | | 6 (startup) 2 (stabilized) | mA |
| g _m | Oscillator transconductance | | 5 | | | mA/V |
| t _{SU(HSE)} ⁽⁴⁾ | Startup time | V _{DD} is stabilized | | 2.8 | | ms |

1. In case f_{HSE} is configured as a direct clock for the SMED logic the maximum frequency can be 24 MHz.
2. The oscillator needs two load capacitors, CL1 and CL2, to act as load for the crystal. The total load capacitance (Cload) is (CL1 x CL2) / (CL1 + CL2). If CL1 = CL2, Cload = CL1 / 2. Some oscillators have built-in load capacitors, CL1 and CL2.
3. The oscillator selection can be optimized in terms of supply current using a high quality resonator with small Rm value.
4. t_{SU(HSE)} is the start-up time measured from the moment it is enabled (by software) to a stabilized 16 MHz oscillation is reached. This value is measured for a standard crystal resonator and it can vary significantly with the crystal manufacturer.

Figure 18. HSE oscillator circuit diagram

The crystal characteristics have to be checked by [Equation 3](#).

Equation 3

$$g_m \gg g_{mCritic}$$

where $g_{mCritic}$ is calculated with the crystal parameters as follows:

Equation 4

$$g_{mCritic} = (2 \times \pi \times f_{HSE})^2 \times R_m (2C_O + C)^2$$

and where:

- R_m : motional resistance^(d)
- L_m : motional inductance^(d)
- C_m : motional capacitance^(d)
- C_O : shunt capacitance^(d)
- $CL1 = CL2 = C$: grounded external capacitance

d. Refer to the application crystal specification.

12.3.5 Internal clock sources and timing characteristics

HSI RC oscillator

Subject to general operating conditions for V_{DD} and T_A .

Table 80. HSI RC oscillator

| Symbol | Parameter | Conditions | Min. ⁽¹⁾ | Typ. | Max. ⁽¹⁾ | Unit |
|---------------|---|--|---------------------|------|---------------------|---------------|
| f_{HSI} | Frequency | | | 16 | | MHz |
| ACC_{HSI} | Accuracy of HSI oscillator (factory calibrated) ⁽¹⁾ , ⁽²⁾ | $V_{DD} = 3.3\text{ V } T_A = 25\text{ °C}$ | -1% | | +1% | % |
| | | $V_{DD} = 3.3\text{ V } -40\text{ °C} \leq T_A \leq 105\text{ °C}$ | -4% | | +4% | |
| | | $V_{DD} = 5\text{ V } -40\text{ °C} \leq T_A \leq 105\text{ °C}$ | -4% | | +4% | |
| $t_{SU(HSI)}$ | HSI oscillator wakeup time including calibration | | | 1 | | μs |

1. Data based on characterization results, not tested in production.

2. Variation referred to f_{HSI} nominal value.

LSI RC oscillator

Subject to general operating conditions for V_{DD} and T_A .

Table 81. LSI RC oscillator

| Symbol | Parameter | Conditions | Min. ⁽¹⁾ | Typ. | Max. ⁽¹⁾ | Unit |
|---------------|-----------------------------|---|---------------------|-------|---------------------|---------------|
| f_{LSI} | Frequency | | | 153.6 | | kHz |
| ACC_{LSI} | Accuracy of LSI oscillator | $3.3\text{ V} \leq V_{DD} \leq 5\text{ V } -40\text{ °C} \leq T_A \leq 105\text{ °C}$ | -10% | | 10% | % |
| $t_{SU(LSI)}$ | LSI oscillator wake-up time | | | 7 | | μs |

1. Guaranteed by design, not tested in production.

PLL internal source clock

Table 82. PLL internal source clock

| Symbol | Parameter | Conditions | Min. | Typ. | Max. ⁽¹⁾ | Unit |
|------------|--------------------------------|---|------|------|---------------------|---------------|
| f_{IN} | Input frequency ⁽²⁾ | $3.3\text{ V} \leq V_{DD} \leq 5\text{ V } -40\text{ °C} \leq T_A \leq 105\text{ °C}$ | | 16 | | MHz |
| f_{OUT} | Output frequency | | | 96 | | |
| t_{lock} | PLL lock time | | | | 200 | μs |

1. Data based on characterization results, not tested in production.

2. PLL maximum input frequency 16 MHz.

12.3.6 Memory characteristics

Flash program and memory/data E²PROM memory

General conditions: $T_A = -40\text{ °C}$ to 105 °C .

Table 83. Flash program memory/data E²PROM memory

| Symbol | Parameter | Conditions | Min. ⁽¹⁾ | Typ. ⁽¹⁾ | Max. ⁽¹⁾ | Unit |
|--------------------|--|---|---------------------|---------------------|---------------------|--------|
| t_{PROG} | Standard programming time (including erase) for byte/word/block (1 byte/4 bytes/128 bytes) | | | 6 | 6.6 | ms |
| | Fast programming time for 1 block (128 bytes) | | | 3 | 3.3 | |
| t_{ERASE} | Erase time for 1 block (128 bytes) | | | 3 | 3.3 | |
| N_{WE} | Erase/write cycles ⁽²⁾ (program memory) | $T_A = 25\text{ °C}$ | 10 K | | | Cycles |
| | | $T_A = 85\text{ °C}$ | 100 K | | | |
| | | $T_A = 105\text{ °C}$ | 35 K | | | |
| t_{RET} | Data retention (program memory) after 10 K erase/write cycles at $T_A = 25\text{ °C}$ | $T_{\text{RET}} = 85\text{ °C}$ | 15 | | | Years |
| | Data retention (program memory) after 10 K erase/write cycles at $T_A = 25\text{ °C}$ | $T_{\text{RET}} = 105\text{ °C}$ | 11 | | | |
| | Data retention (data memory) after 100 K erase/write cycles at $T_A = 85\text{ °C}$ | $T_{\text{RET}} = 85\text{ °C}$ | 15 | | | |
| | Data retention (data memory) after 35 K erase/write cycles at $T_A = 105\text{ °C}$ | $T_{\text{RET}} = 105\text{ °C}$ | 6 | | | |
| I_{DDPRG} | Supply current during program and erase cycles | $-40\text{ °C} \leq T_A \leq 105\text{ °C}$ | | 2 | | mA |

1. Data based on characterization results, not tested in production.
2. The physical granularity of the memory is 4 bytes, so cycling is performed on 4 bytes even when a write/erase operation addresses a single byte.

12.3.7 I/O port pin characteristics

Subject to general operating conditions for V_{DD} and T_A unless otherwise specified. Unused input pins should not be left floating.

Table 84. Voltage DC characteristics

| Symbol | Description | Min. ⁽¹⁾ | Typ. | Max. ⁽¹⁾ | Unit |
|-----------|---|---------------------|------|---------------------|------------|
| V_{IL} | Input low voltage | -0.3 | | $0.3 \times V_{DD}$ | V |
| V_{IH} | Input high voltage ⁽²⁾ | $0.7 \times V_{DD}$ | | V_{DD} | |
| V_{OL1} | Output low voltage at 3.3 V ^{(3), (4)} | | | 0.4 | |
| V_{OL2} | Output low voltage at 5 V ^{(3), (4)} | | | 0.5 | |
| V_{OL3} | Output low voltage high sink at 3.3 V / 5 V ^{(2), (5), (6)} | | | 0.6 | |
| V_{OH1} | Output high voltage at 3.3 V ^{(3), (4)} | $V_{DD} - 0.4$ | | | |
| V_{OH2} | Output high voltage at 5 V ^{(3), (4)} | $V_{DD} - 0.5$ | | | |
| V_{OH3} | Output high voltage high sink at 3.3 V / 5 V ^{(2), (5), (6)} | $V_{DD} - 0.6$ | | | |
| H_{VS} | Hysteresis input voltage ⁽⁷⁾ | $0.1 \times V_{DD}$ | | | |
| R_{PU} | Pull-up resistor | 30 | 45 | 60 | k Ω |

1. Data based on characterization result, not tested in production.
2. All signals are not 5 V tolerant (input signals can't be exceeded V_{DDX} ($V_{DDX} = V_{DD}, V_{DDA}$)).
3. The parameter applicable to signals GPIO0 [5:0] (product depending) (high sink selectable by high speed config.).
4. The parameter applicable to signals: GPIO1 [5:0]/PWM [5:0] (product depending).
5. The parameter applicable to the signal: SWIM.
6. The parameter applicable to the signal: DIGIN [0]/CCO_clk.
7. Applicable to any digital inputs.

Table 85. Current DC characteristics

| Symbol | Description | Min. | Typ. | Max. ⁽¹⁾ | Unit |
|--------------------|--|------|------|---------------------|------|
| I _{OL1} | Standard output low level current at 3.3 V and VOL1 ^{(2), (3)} | | | 1.5 | mA |
| I _{OL2} | Standard output low level current at 5 V and VOL2 ^{(2), (3)} | | | 3 | |
| I _{OLhs1} | High sink output low level current at 3.3 V and VOL3 ^{(2), (4), (5)} | | | 5 | |
| I _{OLhs2} | High sink output low level current at 5 V and VOL3 ^{(2), (4), (5)} | | | 7.75 | |
| I _{OH1} | Standard output high level current at 3.3 V and VOH1 ^{(2), (3)} | | | 1.5 | |
| I _{OH2} | Standard output high level current at 5 V and VOLH2 ^{(2), (3)} | | | 3 | |
| I _{OHhs1} | High sink output high level current at 3.3 V and VOH3 ^{(2), (4), (5)} | | | 5 | |
| I _{OHhs2} | High sink output high level current at 5 V and VOH3 ^{(2), (4), (5)} | | | 7.75 | |
| I _{LKg} | Input leakage current digital - analog $V_{SS} \leq V_{IN} \leq V_{DD}$ ⁽⁶⁾ | | | ± 1 | µA |
| I _{_Inj} | Injection current ^{(7), (8)} | | | ± 4 | mA |
| ΣI _{_Inj} | Total injection current (sum of all I/O and control pins) ⁽⁷⁾ | | | ± 20 | |

1. Data based on characterization result, not tested in production.
2. A high sink selectable by high speed configuration; the parameter applicable to signals: GPIO0 [5:0] (product depending).
3. The parameter applicable to signals: GPIO1 [5:0]/PWM [5:0] (product depending).
4. The parameter applicable to the signal: SWIM.
5. The parameter applicable to the signal: DIGIN [0]/CCO_clk.
6. Applicable to any digital inputs.
7. Maximum value must never be exceeded.
8. Negative injection current on the ADCIN [7:0] signals (product depending) have to avoid since impact the ADC conversion accuracy.

Table 86. Operating frequency characteristics

| Symbol | Description | Min. | Typ. | Max. ⁽¹⁾ | Unit |
|------------------|--|------|------|---------------------|------|
| f _{IL1} | Digital input signal operating frequency ^{(2), (3), (4)} | | | 12 | MHz |
| f _{IH1} | Analog input signal operating frequency ^{(5), (6)} | | | 24 | |
| f _{IH2} | High speed input signal operating frequency ^{(7), (8)} | | | 128 | |
| f _{OL1} | Standard output signal operating frequency with 50 pF max. load ⁽²⁾ | | | 2 | |
| f _{OL2} | High sink output signal operating frequency with 50 pF max. load ^{(2), (3)} | | | 10 | |
| f _{OH1} | High speed output signal operating frequency with 50 pF max. load ⁽⁷⁾ | | | 12 | |
| f _{OH2} | High speed output signal operating frequency with 50 pF max. load ⁽⁸⁾ | | | 32 | |

1. Data based on characterization result, not tested in production
2. A high sink selectable by high speed configuration; parameter applicable to signals: GPIO0 [5:0] (product depending).
3. The parameter applicable to the signal: SWIM.
4. The parameter applicable to signals: DIGIN [5:1] (product depending).
5. The parameter applicable to signals: GPIO0 [3:2] when configured as HSE_Oscin/Oscout.
6. The parameter applicable to any analog signals: ADCIN [7:0], CPP [3:0] and CPM3 (product depending).
7. The parameter applicable to signals: GPIO1 [5:0]/PWM [5:0] (product depending).
8. The parameter applicable to the signal: DIGIN [0]/CCO_clk.

12.3.8 Typical output level curves

This section shows the typical output voltage level curves measured on a single output pin for the three pad family present in the STNRG device.

Standard pad

This pad is associated to the following signals: DIGIN [5:1], SWIM and GPIO0 [5:0] when available.

Figure 19. V_{OH} standard pad at 3.3 V

Figure 20. V_{OL} standard pad at 3.3 V

Figure 21. V_{OH} standard pad at 5 V

Figure 22. V_{OL} standard pad at 5 V

Fast pad

This pad is associated to the PWM [5:0] signals if the external pin is available.

Figure 23. V_{OH} fast pad at 3.3 V

Figure 24. V_{OL} fast pad at 3.3 V

Figure 25. V_{OH} fast pad at 5 V

Figure 26. V_{OL} fast pad at 5 V

High speed pad

This pad is associated to the DIGIN [0] signals.

Figure 27. V_{OH} high speed pad at 3.3 V

Figure 28. V_{OL} high speed pad at 3.3 V

Figure 29. V_{OH} high speed pad at 5 V

Figure 30. V_{OL} high speed pad at 5 V

12.3.9 Reset pin characteristics

Subject to general operating conditions for V_{DD} and T_A unless otherwise specified.

Table 87. NRST pin characteristics

| Symbol | Parameter | Conditions | Min. ⁽¹⁾ | Typ. | Max. ⁽¹⁾ | Unit |
|------------------|--|-------------------------|---------------------|------|---------------------|---------------|
| $V_{IL(NRST)}$ | NRST input low level voltage ⁽¹⁾ | | -0.3 | | $0.3 \times V_{DD}$ | V |
| $V_{IH(NRST)}$ | NRST input high level voltage ⁽¹⁾ | | $0.7 \times V_{DD}$ | | $V_{DD} + 0.3$ | |
| $V_{OL(NRST)}$ | NRST output low level voltage ⁽¹⁾ | $I_{OL} = 2 \text{ mA}$ | | | 0.5 | |
| $R_{PU(NRST)}$ | NRST pull-up resistor ⁽²⁾ | | 30 | 40 | 60 | k Ω |
| $t_{IFP(NRST)}$ | NRST input filtered pulse ⁽³⁾ | | | | 75 | ns |
| $t_{INFP(NRST)}$ | NRST not input filtered pulse ⁽³⁾ | | 500 | | | |
| $t_{OP(NRST)}$ | NRST output filtered pulse ⁽³⁾ | | 15 | | | μs |

1. Data based on characterization results, not tested in production.
2. The RPU pull-up equivalent resistor is based on a resistive transistor.
3. Data guaranteed by design, not tested in production.

12.3.10 I²C interface characteristics

Table 88. I²C interface characteristics

| Symbol | Parameter | Standard mode | | Fast mode ⁽¹⁾ | | Unit |
|----------------------|---|---------------------|---------------------|--------------------------|---------------------|---------------|
| | | Min. ⁽²⁾ | Max. ⁽²⁾ | Min. ⁽²⁾ | Max. ⁽²⁾ | |
| $t_{w(SCLL)}$ | SCL clock low time | 4.7 | | 1.3 | | μs |
| $t_{w(SCLH)}$ | SCL clock high time | 4.0 | | 0.6 | | |
| $t_{su(SDA)}$ | SDA setup time | 250 | | 100 | | ns |
| $t_h(SDA)$ | SDA data hold time | 0 ⁽³⁾ | | 0 ⁽³⁾ | 900 ⁽³⁾ | |
| $t_r(SDA), t_r(SCL)$ | SDA and SCL rise time ($V_{DD} = 3.3 \text{ to } 5 \text{ V}$) ⁽⁴⁾ | | 1000 | | 300 | |
| $t_f(SDA), t_f(SCL)$ | SDA and SCL fall time ($V_{DD} = 3.3 \text{ to } 5 \text{ V}$) ⁽⁴⁾ | | 300 | | 300 | |
| $t_h(STA)$ | START condition hold time | 4.0 | | 0.6 | | μs |
| $t_{su(STA)}$ | Repeated START condition setup time | 4.7 | | 0.6 | | |
| $t_{su(STO)}$ | STOP condition setup time | 4.0 | | 0.6 | | |
| $t_w(STO:STA)$ | STOP to START condition time (bus free) | 4.7 | | 1.3 | | |
| C_b | Capacitive load for each bus line ⁽⁵⁾ | | 50 | | 50 | pF |

1. f_{MASTER} must be at least 8 MHz to achieve maximum fast I²C speed (400 kHz).
2. Data based on standard I²C protocol requirement, not tested in production.
3. The maximum hold time of the start condition has only to be met if the interface does not stretch the low time.
4. I²C multifunction signals require the high sink pad configuration and the interconnection of 1 K Ω pull-up resistances.
5. 50 pF is the maximum load capacitance value to meet the I²C STD timing specifications.

12.3.11 10-bit SAR ADC characteristics

Subject to general operating conditions for V_{DDA} , f_{MASTER} , and T_A unless otherwise specified.

Table 89. ADC characteristics

| Symbol | Parameter | Conditions | Min. | Typ. | Max. | Unit |
|-------------|---|-------------------|------|-------|--|------------|
| N | Resolution | | | 10 | | bit |
| R_{ADCIN} | ADC input impedance | | 1 | | | M Ω |
| f_{ADC} | ADC Clock frequency | | 1 | | 6 ⁽¹⁾ | MHz |
| V_{IN1} | Conversion voltage range for gain x1 | | 0 | | 1.25 ⁽²⁾ , ⁽³⁾ | V |
| V_{IN2} | Conversion voltage range for gain x4 ⁽⁴⁾ | | 0 | | 0.3125 ⁽²⁾ , ⁽³⁾ | |
| V_{ref} | ADC main reference voltage ⁽⁵⁾ | | | 1.250 | | |
| t_S | Sampling time | $f_{ADC} = 6$ MHz | | 0.50 | | μ s |
| t_{STAB} | Wakeup time from ADC standby | | | 30 | | |
| t_{CONV1} | Single conversion time including sampling time | $f_{ADC} = 6$ MHz | | 2.42 | | |
| t_{CONV2} | Continuous conversion time including sampling time | $f_{ADC} = 6$ MHz | | 3 | | |

1. Frequency generated selecting the PLL source clock.
2. Maximum input analog voltage cannot exceed V_{DDA} .
3. Exceeding the maximum voltage on the ADCIN [7:0] signals (product depending) for the related conversion scale must be avoided since the ADC conversion accuracy can be impacted.
4. Product depending
5. ADC reference voltage at $T_A = 25$ °C.

ADC accuracy characteristics at V_{DD}/V_{DDA} 3.3 V

Table 90. ADC accuracy characteristics at V_{DD}/V_{DDA} 3.3 V

| Symbol | Parameter | Conditions ⁽¹⁾ | Typ. ⁽²⁾ | Min. ⁽³⁾ | Max. ⁽³⁾ | Unit |
|-----------|---|---|---------------------|---------------------|---------------------|------|
| $ E_T $ | Total unadjusted error ^{(4), (5), (6)} | $f_{ADC} = 6$ MHz gain 1 | 2.8 | | | LSB |
| $ E_{O }$ | Offset error ^{(4), (5), (6)} | | 0.3 | | | |
| $ E_G $ | Gain error ^{(4), (5), (6), (7)} | | 0.4 | | | |
| E_{O+G} | Offset + gain error ^{(7), (8)} | | | -8.5 | 9.3 | |
| E_{O+G} | Offset + gain error ^{(7), (9)} | | | -11 | 11 | |
| E_{O+G} | Offset + gain error ^{(7), (10)} | | | -14.3 | 11.3 | |
| $ E_D $ | Differential linearity error ^{(2), (3), (4)} | | 0.5 | | | |
| $ E_L $ | Integral linearity error ^{(4), (5), (6)} | 1.4 | | | | |
| $ E_T $ | Total unadjusted error ^{(4), (5), (6)} | $f_{ADC} = 6$ MHz gain 4 ⁽¹¹⁾ | 2.8 | | | |
| $ E_{O }$ | Offset error ^{(4), (5), (6)} | | 0.3 | | | |
| $ E_G $ | Gain error ^{(4), (5), (6), (7)} | | 0.4 | | | |
| E_{O+G} | Offset + gain error ^{(7), (8)} | | | -12.7 | 15.5 | |
| E_{O+G} | Offset + gain error ^{(5), (9)} | | | -16.7 | 18.8 | |
| E_{O+G} | Offset + gain error ^{(7), (10)} | | | -19.2 | 18.8 | |
| $ E_D $ | Differential linearity error ^{(4), (5), (6)} | | 0.5 | | | |
| $ E_L $ | Integral linearity error ^{(4), (5), (6)} | 1.4 | | | | |

1. Measured with $R_{AIN} < 10$ k Ω (R_{AIN} external series resistance interconnected between the AC signal generator and the ADC input pin).
2. Temperature operating: $T_A = 25$ °C.
3. Data based on characterization results, not tested in production.
4. ADC accuracy vs. negative injection current. Injecting negative current on any of the analog input pins should be avoided as this reduces the accuracy of the conversion being performed on another analog input. It is recommended a Schottky diode (pin to ground) to be added to standard analog pins which may potentially inject the negative current. Any positive injection current within the limits specified for $I_{INJ(PIN)}$ and $\Sigma I_{INJ(PIN)}$ in the I/O port pin characteristic section does not affect the ADC accuracy. The ADC accuracy parameters may be also impacted exceeding the ADC maximum input voltage V_{IN1} or V_{IN2} .
5. Results in manufacturing test mode.
6. Data aligned with trimming voltage parameters.
7. Gain error evaluation with the two point method.
8. Temperature operating range: 0 °C $\leq T_A \leq 85$ °C.
9. Temperature operating range: -25 °C $\leq T_A \leq 105$ °C.
10. Temperature operating range: -40 °C $\leq T_A \leq 105$ °C.
11. Product depending.

ADC accuracy characteristics at V_{DD}/V_{DDA} 5 VTable 91. ADC accuracy characteristics at V_{DD}/V_{DDA} 5 V

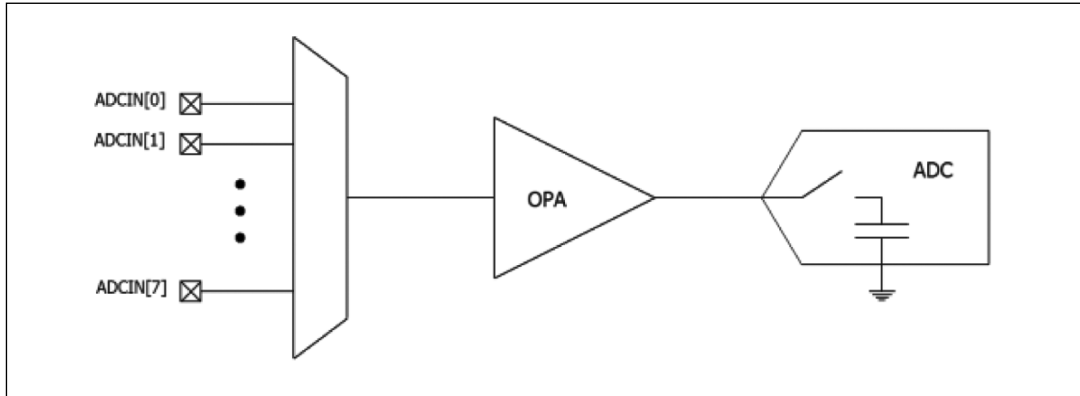

| Symbol | Parameter | Conditions ⁽¹⁾ | Typ. ⁽²⁾ | Min. ⁽³⁾ | Max. ⁽³⁾ | Unit |

| $ E_D $ | Differential linearity error ^{(4), (5), (6)} | | 0.8 | | | |
| $ E_L $ | Integral linearity error ^{(4), (5), (6)} | 2.0 | | | | |

1. Measured with $R_{AIN} < 10$ k Ω (R_{AIN} external series resistance interconnected between the AC signal generator and the ADC input pin).
2. Temperature operating: $T_A = 25$ °C.
3. Data based on characterization results, not tested in production.
4. ADC accuracy vs. negative injection current. Injecting negative current on any of the analog input pins should be avoided as this reduces the accuracy of the conversion being performed on another analog input. It is recommended a Schottky diode (pin to ground) to be added to standard analog pins which may potentially inject negative current. Any positive injection current within the limits specified for $I_{INJ(PIN)}$ and $\Sigma I_{INJ(PIN)}$ in the I/O port pin characteristic section does not affect the ADC accuracy. The ADC accuracy parameters may be also impacted exceeding the ADC maximum input voltage V_{IN1} or V_{IN2} .
5. Results in manufacturing test mode.
6. Data aligned with trimming voltage parameters.
7. Gain error evaluation with the two point method.
8. Temperature operating range: 0 °C $\leq T_A \leq 85$ °C.
9. Temperature operating range: -25 °C $\leq T_A \leq 105$ °C.
10. Temperature operating range: -40 °C $\leq T_A \leq 105$ °C.
11. Product depending.

ADC equivalent input circuit

Figure 31 shows the ADC equivalent input circuit.

Figure 31. ADC equivalent input circuit

Note: The gain x1 ADC input analog voltage range is from 0 up to 1.25 V.
 The gain x4 ADC input analog voltage range is from 0 up to 312.5 mV (check availability on device).
 Maximum input analog voltage cannot exceed V_{DDA} .
 ADC input impedance > 1 MΩ.
 The ADCIN [7:0] input pins are provided by the ESD protection diodes.

ADC conversion accuracy

Figure 32. ADC conversion accuracy

ADC accuracy parameter definitions:

- E_T = total unadjusted error: maximum deviation between the actual and the ideal transfer curves.
- E_O = offset error: deviation between the first actual transition and the first ideal one.
- E_{OG} = offset + gain error (1-point gain): deviation between the last ideal transition and the last actual one.
- E_G = gain error (2-point gain): defined so that $E_{OG} = E_O + E_G$ (parameter correlated to the deviation of the characteristic slope).
- E_D = differential linearity error: maximum deviation between actual steps and the ideal one.
- E_L = integral linearity error: maximum deviation between any actual transition and the end-point correlation line.

12.3.12 Analog comparator characteristics

Table 92. Analog comparator characteristics

| Symbol | Parameter | Conditions | Min. ⁽¹⁾ | Typ. | Max. ⁽¹⁾ | Unit |
|---------------------|--|----------------------------------|---------------------|------|--------------------------|------|
| V _{CPP} | Comparator positive input voltage range | -40 °C ≤ T _A ≤ 105 °C | 0 | | 1.23 ⁽²⁾ | V |
| V _{CPM} | Comparator negative external input voltage range | | 0 | | 1.23 ^{(2), (3)} | V |
| C _{IN} | Input capacitance | | | 3 | | pF |
| V _{offset} | Comparator offset error | | | | 15 | mV |
| t _{COMP} | Comparison delay time | | | | 50 ^{(4), (5)} | ns |

1. Data based on characterization results, not tested in production.
2. Maximum analog input voltage cannot exceed V_{DDA}.
3. The comparator 3 can be configured with the external reference voltage signal CPM3.
4. The overdrive voltage is ± 50 mV.
5. This parameter doesn't consider the delay time of comparator signal synchronization stages and SMED logic.

Table 93. Analog comparator hysteresis at V_{DD}/V_{DDA} 3.3 V

| Symbol | Parameter | Conditions | Hysteresis positive ⁽¹⁾ | | Hysteresis negative ⁽¹⁾ | | Unit |
|---|------------------------------|----------------------------------|------------------------------------|------|------------------------------------|------|------|
| | | | Min. | Max. | Max. | Max. | |
| V _{HYST0} | Hysteresis voltage code 0 | -40 °C ≤ T _A ≤ 105 °C | No hysteresis | | | | mV |
| V _{HYST1} , V _{HYST2} | Hysteresis voltage code 1, 2 | | N. A. | | | | |
| V _{HYST3} | Hysteresis voltage code 3 | | 4 | 52 | 0 | -60 | |
| V _{HYST4} | Hysteresis voltage code 4 | | 13 | 78 | -13 | -80 | |
| V _{HYST5} | Hysteresis voltage code 5 | | 41 | 148 | -45 | -150 | |
| V _{HYST6} | Hysteresis voltage code 6 | | 56 | 203 | -58 | -205 | |
| V _{HYST7} | Hysteresis voltage code 7 | | 123 | 406 | -125 | -403 | |

1. Data based on characterization results, not tested in production.

Table 94. Analog comparator hysteresis at V_{DD}/V_{DDA} 5 V

| Symbol | Parameter | Conditions | Hysteresis positive ⁽¹⁾ | | Hysteresis negative ⁽¹⁾ | | Unit |
|------------------------|------------------------------|---|------------------------------------|------|------------------------------------|------|------|
| | | | Min. | Max. | Max. | Max. | |
| V_{HYST0} | Hysteresis voltage code 0 | $-40\text{ °C} \leq T_A \leq 105\text{ °C}$ | No hysteresis | | | | mV |
| V_{HYST1}, V_{HYST2} | Hysteresis voltage code 1, 2 | | N. A. | | | | |
| V_{HYST3} | Hysteresis voltage code 3 | | N. A. | | -1 | -56 | |
| V_{HYST4} | Hysteresis voltage code 4 | | 2 | 82 | -13 | -81 | |
| V_{HYST5} | Hysteresis voltage code 5 | | 17 | 154 | -42 | -148 | |
| V_{HYST6} | Hysteresis voltage code 6 | | 37 | 202 | -57 | -203 | |
| V_{HYST7} | Hysteresis voltage code 7 | | 119 | 398 | -124 | -400 | |

1. Data based on characterization results, not tested in production.

12.3.13 DAC characteristics

Table 95. DAC characteristics

| Symbol | Parameter | Conditions | Min. ⁽¹⁾ | Typ. | Max. ⁽¹⁾ | Unit |
|-------------------|------------------------|---|---------------------|------|---------------------|------|
| N | Resolution | $-40\text{ °C} \leq T_A \leq 105\text{ °C}$ | | 4 | | bit |
| $V_{full\ scale}$ | DAC full scale | | 1.2 | | 1.26 | V |
| V_{offset} | DAC offset | | | | 4 | mV |
| V_{dac} | DAC out voltage | | V_{offset} | | $V_{full\ scale}$ | mV |
| LSB | | | | 82 | | mV |
| INL | Integral non linearity | | | | 0.12 | LSB |

1. Data based on characterization results, not tested in production.

Equation 5

$$n[0, 15]: V_{dac(n)} = \frac{(V_{fullscale} - V_{offset})}{15} \cdot (n) + V_{offset}$$

Equation 6

$$n[1, 14]: V_{dac(n)} = \frac{(V_{fullscale} - V_{offset})}{15} \cdot (n + INL) + V_{offset}$$

where:

- $V_{fullscale} = V_{fullscale}(\text{sample}, T)$
- $V_{offset} = V_{offset}(\text{sample}, T)$
- $INL = INL(\text{sample}, n)$

12.4 EMC characteristics

12.4.1 Electrostatic discharge (ESD)

Electrostatic discharges (3 positive then 3 negative pulses separated by 1 second) are applied to the pins of each sample according to each pin combination. The sample size depends on the number of supply pins in the device (3 parts * (n + 1) supply pin).

Table 96. ESD absolute maximum ratings

| Symbol | Ratings | Conditions | Maximum value | Unit |
|-----------------------|---|---|---------------|------|
| V _{ESD(HBM)} | Electrostatic discharge voltage (human body model) | T _A = 25 °C, conforming to JEDEC/JESD22-A114E | 2000 | V |
| V _{ESD(CDM)} | Electrostatic discharge voltage (charge device model) | T _A = 25 °C, conforming to ANSI/ESD STM 5.3.1 ESDA | 500 | |
| V _{ESD(MM)} | Electrostatic discharge voltage (machine model) | T _A = 25 °C, conforming to JEDEC/JESD-A115-A | 200 | |

Data based on characterization results, not tested in production.

12.4.2 Static latch-up

Two complementary static tests are required on 10 parts to assess the latch-up performance.

A supply overvoltage (applied to each power supply pin) and a current injection (applied to each input, output and configurable I/O pin) are performed on each sample. This test conforms to the EIA/JESD 78 IC latch-up standard.

Table 97. Electrical sensitivity

| Symbol | Parameter | Conditions | Level |
|--------|-----------------------|-------------------------|-------|
| LU | Static latch-up class | T _A = 105 °C | A |

13 Thermal characteristics

The STNRG functionality cannot be guaranteed when the device operating exceeds the maximum chip junction temperature (T_{Jmax}).

T_{Jmax} , in °C, may be calculated using [Equation 7](#):

Equation 7

$$T_{Jmax} = T_{Amax} + (PD_{max} \times \Theta_{JA})$$

where:

T_{Amax} is the maximum ambient temperature in °C

Θ_{JA} is the package junction to ambient thermal resistance in °C/W

P_{Dmax} is the sum of P_{INTmax} and $P_{I/Omax}$ ($P_{Dmax} = P_{INTmax} + P_{I/Omax}$)

P_{INTmax} is the product of I_{DD} and V_{DD} , expressed in watts. This is the maximum chip internal power.

$P_{I/Omax}$ represents the maximum power dissipation on output pins where:

$$P_{I/Omax} = (V_{OL} \times I_{OL}) + \Sigma[(V_{DD} - V_{OH}) \times I_{OH}],$$

taking into account the actual V_{OL}/I_{OL} and V_{OH}/I_{OH} of the I/Os at low and high level.

Table 98. Package thermal characteristics

| Symbol | Parameter | Value | Unit |
|---------------|---|-------|------|
| Θ_{JA} | TSSOP38 - thermal resistance junction to ambient ⁽¹⁾ | 80 | °C/W |

1. Thermal resistance is based on the JEDEC JESD51-2 with the 4-layer PCB in a natural convection environment.

14 Package information

In order to meet environmental requirements, ST offers these devices in different grades of ECOPACK® packages, depending on their level of environmental compliance. ECOPACK specifications, grade definitions and product status are available at: www.st.com. ECOPACK is an ST trademark.

14.1 TSSOP38 package information

Figure 33. TSSOP38 package outline

Table 99. TSSOP38 package mechanical data⁽¹⁾

| Symbol | Dimensions (mm) | | |
|-------------------|-----------------|------|------|
| | Min. | Typ. | Max. |
| A | | | 1.20 |
| A1 | 0.05 | | 0.15 |
| A2 | 0.80 | 1.00 | 1.05 |
| b | 0.17 | | 0.27 |
| c | 0.09 | | 0.20 |
| D ⁽²⁾ | 9.60 | 9.70 | 9.80 |
| E | 6.20 | 6.40 | 6.60 |

| e | | 0.50 | |
| L | 0.45 | 0.60 | 0.75 |
| L1 | | 1.00 | |
| k | 0 | | 8 |
| aaa | | | 0.10 |

1. "TSSOP stands for "Thin Shrink Small Outline Package".
2. "Dimensions "D" and "E1" do not include mold flash or protrusions. Mold flash or protrusions shall not exceed 0.15 mm per side.

15 STNRG development tools

The development tools for the STNRG microcontroller are provided by:

- Raisonance with the C compiler and the integrated development environment (Ride7), which provides start-to-finish control of application development including the code editing, compilation, optimization and debugging.
The Ride7 supports the RLink in-circuit debugger/programmer using the SWIM interface (USB/SWIM).
- IAR Embedded Workbench® for STM8. The IAR Embedded Workbench IAR-EWSTM8 is a software development tool with the highly optimizing C and C++ compiler for the STM8 CPU device.
The workbench supports the ST-LINK and STIce debug probes using the SWIM interface (USB/SWIM).

16 Order codes

Table 100. Ordering information

| Order code | Package | Packaging |
|-------------|---------|---------------|
| STNRG388A | TSSOP38 | Tube |
| STNRG388ATR | | Tape and reel |
