

Low voltage 16-bit constant current LED sink driver with auto power saving

Datasheet - production data

Description

The STP16CPS05 is a monolithic, low voltage, low current power 16-bit shift register designed for LED panel displays. The STP16CPS05 contains a 16-bit serial-in, parallel-out shift register that feeds a 16-bit, D-type storage register. In the output stage, sixteen regulated current sources provide from 5 mA to 100 mA constant current to drive the LEDs. The auto power shut-down and auto power-ON feature allows the device to save power without any external intervention. The output current setup time is 40 ns (typ.), thus improving the system performance. The LEDs' brightness can be controlled by using an external resistor to adjust the STP16CPS05 output current. The STP16CPS05 guarantees a 20 V output driving capability, allowing users to connect more LEDs in series. The high clock frequency, 30 MHz, makes the device suitable for high data rate transmission. The 3.3 V voltage supply is useful in applications that interface with a 3.3 V microcontroller.

Features

- Low voltage power supply down to 3 V
- 16 constant current output channels
- Adjustable output current through external resistor

- Auto power-saving feature minimizes the quiescent current if no active data is detected on the latches
- Can be driven by a 3.3 V microcontroller
- Output current: 5-100 mA
- Max clock frequency 30 MHz
- ESD protection: 2 kV HBM, 200 V MM

- 1 Latch and output enable terminals are Level-sensitive and are not synchronized with rising or falling edge of CLK signal.
- 2 When LE terminal is at low level, the latch circuit holds previous set of data.
- 3 When LE terminal is at high level, the latch circuit refreshes new set of data from SDI chain.
- 4 When \overline{OE} is at low level the output terminals Out 0 to Out 15 respond to data in the latch circuits, either '1' for ON or '0' for OFF.
- 5 When \overline{OE} is at high level, all output terminals are switched OFF.
