## 5 On-board Peripherals

### 5.1 System Controller CPLD

The System Controller CPLD (U2) is provided by Lattice Semiconductor LCMXO2-256HC (MachXO2 Product Family). The SC-CPLD is the central system management unit where essential control signals are logically linked by the implemented logic in CPLD firmware, which generates output signals to control the system, the on-board peripherals and the interfaces. Interfaces like JTAG and I<sup>2</sup>C between the on-board peripherals and to the FPGA module are by-passed, forwarded and controlled by the System Controller CPLD.

Other tasks of the System Controller CPLD are the monitoring of the power-on sequence and to display the programming state of the FPGA module.

For detailed information, refer to the reference page of the SC CPLD firmware of this module.

### 5.2 DDR Memory

By default TE0841 module has two K4A8G165WB-BIRC DDR4 SDRAM chips arranged into 32-bit wide memory bus providing total of 2 GBytes of on-module RAM. Different memory sizes are available optionally.

### 5.3 Quad SPI Flash Memory

On-module QSPI flash memory (U6) on the TE0841-01 is provided by Micron Serial NOR Flash Memory N25Q512A11G1240E with 512-Mbit (64 MByte) storage capacity. This non volatile memory is used to store initial FPGA configuration. Besides FPGA configuration, remaining free flash memory can be used for user application and data storage. All four SPI data lines are connected to the FPGA allowing x1, x2 or x4 data bus widths. Maximum data rate depends on the selected bus width and clock frequency used.

 SPI Flash QE (Quad Enable) bit must be set to high or FPGA is unable to load its configuration from flash during power-on. By default this bit is set to high at the manufacturing plant.

### 5.4 Programmable Clock Generator

There is a Silicon Labs I<sup>2</sup>C programmable quad PLL clock generator on-board (Si5338A, U2) to generate various reference clocks for the module.

## 6 Power and Power-On Sequence

### 6.1 Power Consumption

The maximum power consumption of a module mainly depends on the design running on the FPGA.

Xilinx provide a power estimator excel sheets to calculate power consumption. It's also possible to evaluate the power consumption of the developed design with Vivado. See also Trenz Electronic Wiki FAQ.

Power Input	Typical Current
VIN	TBD*
3.3VIN	TBD*

**Table 12:** Typical power consumption

\* TBD - To Be Determined soon with reference design setup.

Single 3.3V power supply with minimum current capability of 4A for system startup is recommended.

For the lowest power consumption and highest efficiency of the on-board DC-DC regulators it is recommended to power the module from one single 3.3V supply. All input power supplies should have a nominal value of 3.3V. Although the input power supplies can be powered up in any order, it is recommended to power them up simultaneously.

 To avoid any damage to the module, check for stabilized on-board voltages should be carried out (i.e. power good and enable signals) before powering up any FPGA's I/O bank voltages VCCO\_x. All I/Os should be tri-stated during power-on sequence.

## 6.2 Power Distribution Dependencies

Figure 3: TE0841-02 Power Distribution Diagram

See also Xilinx datasheet [DS892](#) for additional information. User should also check related base board documentation when intending base board design for TE0841 module.

### 6.3 Power-On Sequence

The TE0841 SoM meets the recommended criteria to power up the Xilinx FPGA properly by keeping a specific sequence of enabling the on-board DC-DC converters dedicated to the particular functional units of the FPGA chip and powering up the on-board voltages.

Following diagram clarifies the sequence of enabling the particular on-board voltages, which will power-up in descending order as listed in the blocks of the diagram:

**Figure 4: TE0841-02 Power-On Sequence Diagram**

## 6.4 Power Rails

Power Rail Name	B2B JM1 Pins	B2B JM2 Pins	Input/Output	Notes

12 mm, Single-Ended	7.5 GHz / 15 Gbps
12 mm, Differential	6.5 GHz / 13 Gbps
5 mm, Single-Ended	11.5 GHz / 23 Gbps
5 mm, Differential	7.0 GHz / 14 Gbps

### 7.3 Current Rating

Current rating of Samtec Razor Beam™ LSHM B2B connectors is 2.0A per pin (2 adjacent pins powered).

### 7.4 Connector Mechanical Ratings

- Shock: 100G, 6 ms Sine
- Vibration: 7.5G random, 2 hours per axis, 3 axes total
