Symbol	Parameter	Value	Unit

V_{in}	Input voltage ⁽³⁾	$V_{DD}-0.3$ to $V_{CC}+0.3$

T_j	Maximum junction temperature	150	
R_{thja}	Thermal resistance junction-to-ambient ⁽⁴⁾ SOT23-5	250	°C/W
R_{thjc}	Thermal resistance junction-to-case ⁽⁴⁾ SOT23-5	81	
ESD	HBM: human body model ⁽⁵⁾	1	kV
	MM: machine model ⁽⁶⁾	100	V
	CDM: charged device model ⁽⁷⁾	1.5	kV
	Latch-up immunity	200	mA
	Lead temperature (soldering, 10 sec.)	260	°C

- All voltage values, except differential voltage, are with respect to network ground terminal.
- The differential voltage is the non-inverting input terminal with respect to the inverting input terminal. If $V_{id} > \pm 1$ V, the maximum input current must not exceed ± 1 mA. In this case ($V_{id} > \pm 1$ V), an input series resistor must be added to limit input current.
- Do not exceed 14 V.
- Short-circuits can cause excessive heating and destructive dissipation. R_{th} are typical values.
- Human body model: a 100 pF capacitor is charged to the specified voltage, then discharged through a 1.5 k Ω resistor between two pins of the device. This is done for all couples of connected pin combinations while the other pins are floating.
- Machine model: a 200 pF capacitor is charged to the specified voltage, then discharged directly between two pins of the device with no external series resistor (internal resistor < 5 Ω). This is done for all couples of connected pin combinations while the other pins are floating.
- Charged device model: all pins and the package are charged together to the specified voltage and then discharged directly to ground through only one pin. This is done for all pins.
