

## Ultra low power video buffer/filter with power-down

### Features

- Very low consumption: 1.7 mA
- Ultra low power-down mode: 4 nA typ., 500 nA max.
- Internal 6<sup>th</sup> order reconstruction filter
- Internal gain of 6 dB
- Rail-to-rail output buffer for 75  $\Omega$  video line
- Excellent video performance
  - Differential gain 0.5%
  - Differential phase 0.10°
  - Group delay of 10 ns
- SAG correction
- Bottom of video signal close to 0 V
- Tested with 2.5 V and 3.3 V single supply
- Data min. and max. are physically tested and guaranteed during production (consumption, gain, filtering, and other parameters are guaranteed)

### Applications

- Mobile phones
- Digital still camera
- Digital video camera
- Portable DVD players

### Description

The TSH122 is a video buffer that uses a voltage feedback amplifier, with an internal gain of 6 dB, an output rail-to-rail, an internal input DC-shift and a SAG correction. A power-down function allows switching to a sleep mode with an ultra-low consumption.

The TSH122 features a 6th-order internal reconstruction filter to attenuate the parasitic frequency of 27 MHz from the clock of the video DAC.

The TSH122 operates from 2.25 to 5 V single power supplies and is tested at 2.5 V and 3.3 V.

The TSH122 is a single operator available in a tiny SC70 plastic package for space saving.

# 1 Absolute maximum ratings and operating conditions

**Table 1. Absolute maximum ratings**

Symbol	Parameter	Value	Unit
V <sub>CC</sub>	Supply voltage <sup>(1)</sup>	5.5	V
V <sub>in</sub>	Maximum input amplitude	0 to V <sub>CC</sub>	V
T <sub>stg</sub>	Storage temperature	-65 to +150	°C
T <sub>j</sub>	Maximum junction temperature	150	°C
R <sub>thja</sub>	SC70 thermal resistance junction to ambient area	205	°C/W
R <sub>thjc</sub>	SC70 thermal resistance junction to case	172	°C/W
P <sub>max</sub>	Maximum power dissipation for T <sub>j</sub> =150°C		
	T <sub>amb</sub> = +25°C T <sub>amb</sub> = +85°C	609 317	mW
ESD	CDM: charged device model <sup>(2)</sup>	1.5	kV
	HBM: human body model <sup>(3)</sup>	1.5	kV
	MM: machine model <sup>(4)</sup>	300	V
	Output short-circuit	(5)	

1. All voltage values, except differential voltage, are with respect to network terminal.
2. Charged device model: all pins and the package are charged together to the specified voltage and then discharged directly to the ground through only one pin. This is done for all pins.
3. Human body model: a 100 pF capacitor is charged to the specified voltage, then discharged through a 1.5 kΩ resistor between two pins of the device. This is done for all couples of connected pin combinations while the other pins are floating.
4. Machine model: a 200 pF capacitor is charged to the specified voltage, then discharged directly between two pins of the device with no external series resistor (internal resistor < 5 Ω). This is done for all couples of connected pin combinations while the other pins are floating.
5. An output current limitation protects the circuit from transient currents. Short-circuits can cause excessive heating. Destructive dissipation can result from short-circuits on amplifiers.

**Table 2. Operating conditions**

Symbol	Parameter	Value	Unit
V <sub>CC</sub>	Power supply voltage	2.25 to 5 <sup>(1)</sup>	V
T <sub>oper</sub>	Operating free air temperature range	-40 to +85	°C

1. Tested in full production at 0 V/2.5 V and 0 V/3.3 V single power supply.

## 2 Electrical characteristics

Table 3.  $V_{CC} = +2.5V, +3.3V, T_{amb} = 25^{\circ}C$  (unless otherwise specified)

Symbol	Parameter	Test conditions	Min.	Typ.	Max.	Unit
<b>DC performance</b>

## 3 Application information

### 3.1 Power supply considerations

Correct power supply bypassing is very important for optimizing performance in high-frequency ranges. The bypass capacitors should be placed as close as possible to the IC pins to improve high-frequency bypassing. A capacitor greater than  $10\ \mu\text{F}$  is necessary to minimize the distortion. For better quality bypassing, we recommend adding a  $10\ \text{nF}$  capacitor, also placed as close as possible to the IC pins.

Figure 23. Circuit for power supply bypassing

Figure 24. Supply noise rejection

### 3.2 Implementation considerations

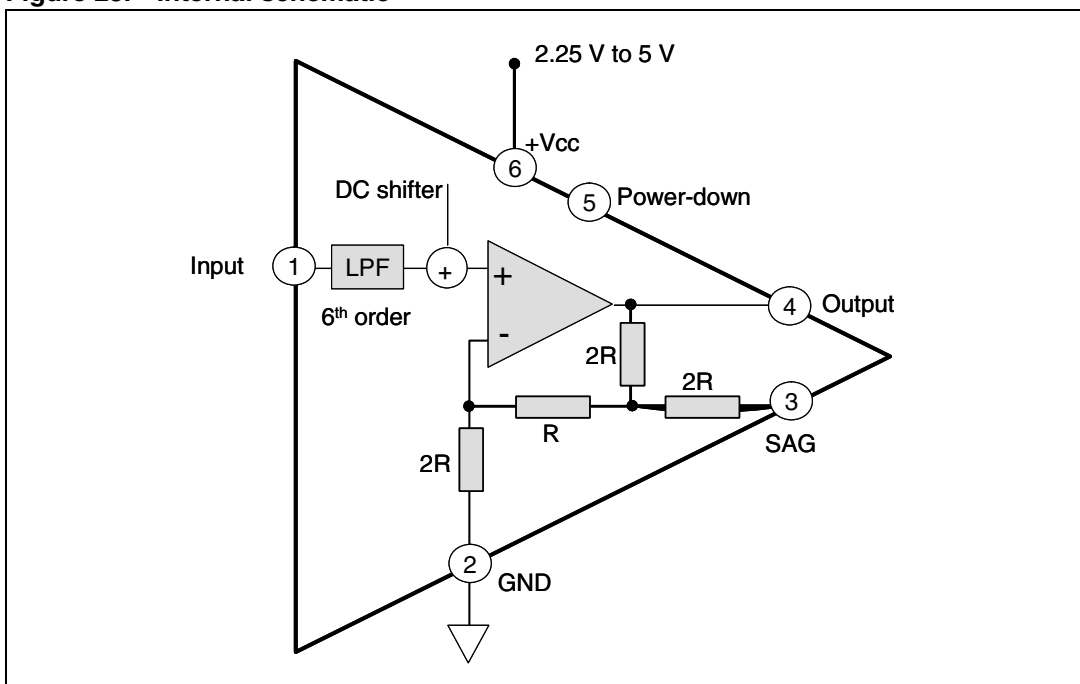

#### 3.2.1 Input

The DC level shifter optimizes the position of the video signal with no clamping on the output rails.

#### 3.2.2 Filter

A reconstruction filter is used to attenuate the DAC's sampling frequency because it generates a parasitic signal in the video spectrum (typically at 27 MHz in the case of standard video). This function is fulfilled while keeping a low group delay and a good gain flatness along the video band.

Figure 25. Internal schematic

#### 3.2.3 Output

In an AC-coupling configuration, the SAG correction allows use of two small low-cost capacitors in place of one large capacitor (see [Figure 26](#)). The AC-coupling output reduces the power consumption by removing the DC component included in the signal.

Nevertheless, the output can be directly connected to the line without any capacitor. In this case, the OUT and SAG pins are connected together and the equivalent gain of the buffer remains at 6 dB (see [Figure 27](#)).

Figure 27. Schematic diagram without output capacitor

### 3.3 Using the TSH122 to drive a Cvbs signal

Figure 28. Details on Cvbs (NTSC color bar 100%)

With its internal DC shift, the TSH122 can drive a video signal from the DAC output as low as 0 V (bottom of the synchronization tip at 0 V - see [Figure 14](#)).

## 4 Package information

In order to meet environmental requirements, STMicroelectronics offers these devices in ECOPACK<sup>®</sup> packages. These packages have a lead-free second level interconnect. The category of second level interconnect is marked on the package and on the inner box label, in compliance with JEDEC Standard JESD97. The maximum ratings related to soldering conditions are also marked on the inner box label. ECOPACK is an STMicroelectronics trademark. ECOPACK specifications are available at: [www.st.com](http://www.st.com).
