

μPC258, 4558

Low Noise Dual Operational Amplifier

R03DS0145EJ0100

Rev.1.00

2019.06.13

DESCRIPTION

The μPC258 and 4558 are dual operational amplifier with a built-in phase compensation circuit, feature high speed, wide band and low noise.

Therefore, applications such as active filters, audio amplifiers and VCOs can be realized with a simple circuit configuration.

Depending on the operating ambient temperature, μPC258 is suitable for communication application while μPC4558 is suitable for general-purpose usage.

In addition, special arrangement products with sorted DC items are available.

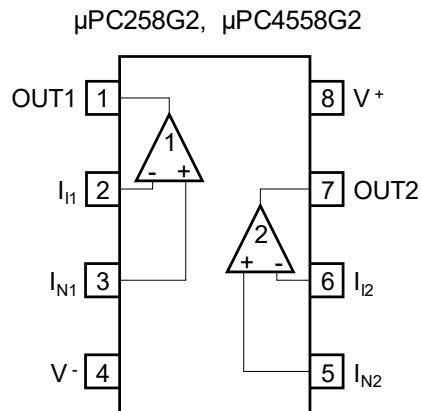

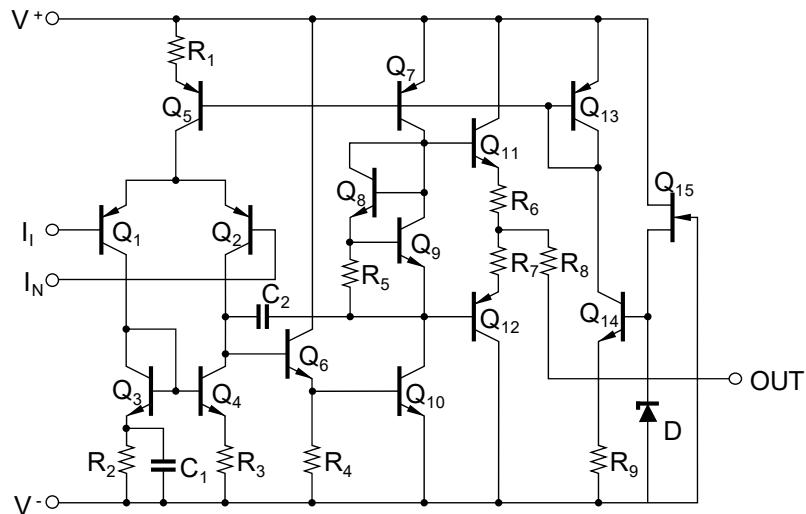

Along with this series of lineup, the quad type op-amp μPC458 and 4741 with same circuit configuration are also available.

FEATURES

- Input Offset Voltage $\pm 0.5 \text{ mV}$ (TYP.)
- Input Offset Current $\pm 5 \text{ nA}$ (TYP.)
- Input Bias Current 60 nA (TYP.)
- Slew Rate $1.0 \text{ V}/\mu\text{s}$ (TYP.)
- Input Equivalent Noise Voltage (RIAA) $1.0 \mu\text{V}_{\text{r.m.s.}}$ (TYP.)
- Built-In Phase Compensation Circuit
- Built-In Output Short Circuit Protection
- Standard Dual Op-Amp terminal connection (pin compatible)

ORDERING INFORMATION

Ordering Name	Sorting Content	Package
μPC258G2-A	General product	8-pin plastic SOP (5.72 mm (225 mil))
μPC258G2(5)-A	DC item sorted product	8-pin plastic SOP (5.72 mm (225 mil))
μPC4558G2-A	General product	8-pin plastic SOP (5.72 mm (225 mil))
μPC4558G2 (5)-A	DC item sorted product	8-pin plastic SOP (5.72 mm (225 mil))

EQUIVALENT CIRCUIT (1/2 Circuit)**PIN CONFIGURATION (Top View)****ABSOLUTE MAXIMUM RATINGS (T_A = 25 °C)**

PARAMETER	SYMBOL	μPC258G2 μPC258G2(5)	μPC4558G2 μPC4558G2(5)	UNIT
Supply Voltage ^{Note1}	V ⁺ - V ⁻	-0.3 ~ +36		V

Input Voltage ^{Note2}	V _I	V ⁻ -0.3 ~ V ⁺ +0.3		V
Output Applied Voltage ^{Note3}	V _O	V ⁻ -0.3 ~ V ⁺ +0.3		V
Total Power Dissipation ^{Note4}	P _T	440		mW
Output Short Circuit Duration ^{Note5}		indefinite		s
Operating Ambient Temperature	T _A	-40 ~ +85	-20 ~ +80	°C
Storage Temperature	T _{stg}	-55 ~ +125		°C

- [Note]
1. Note that reverse connections of the power supply may damage the ICs.
 2. The input terminal must be apply within the input voltage range to avoid deteriorating or damaging the device characteristic. Do not exceed the ratings including during transition state such as ON/OFF, etc. The Op-Amp input voltage must operates within the electrical characteristics range of input common-mode voltage.
 3. The output terminal must be apply within the output voltage range to avoid deteriorating or damaging the device characteristic. Do not exceed the ratings including during transition state such as ON/OFF, etc. The Op-Amp output voltage must operates within the electrical characteristics range of maximum output voltage.
 4. This is the value at T_A ≤ +25 °C. De-rate value at -4.4 mW/°C when T_A > 25 °C.
 5. Please use the total loss and the de-rating value from Note 4.

RECOMMENDED OPERATING CONDITIONS

Output Voltage Swing	V_{OM}	± 10	± 13		V	$R_L \geq 2\text{ k}\Omega$
Common Mode Input Voltage Range	V_{ICM}	± 12	± 14		V	
Slew Rate	SR		1.0		$\text{V}/\mu\text{s}$	$A_V = 1$
Input Equivalent Noise Voltage	V_n		6		μV_{p-p}	$R_S = 1\text{ k}\Omega, f = 1\text{ Hz} \sim 1\text{ kHz}$ (Fig 1)
Channel Separation			105		dB	$f = 1\text{ kHz}$ (Fig 2)

μPC258(5), μPC4558(5) ($T_A = 25^\circ\text{C}$, $V^\pm = \pm 15\text{ V}$)

PARAMETER	SYMBOL	MIN.	TYP.	MAX.	UNIT	TEST CONDITION
Input Offset Voltage	V_{IO}		± 0.5	± 2.0	mV	$R_S \leq 10\text{ k}\Omega$
Input Offset Current	I_{IO}		± 5	± 50	nA	
Input Bias Current ^{Note6}	I_B		60	100	nA	
Large Signal Voltage Gain	A_V	50000	100000			$R_L \geq 2\text{ k}\Omega, V_O = \pm 10\text{ V}$
Power Consumption	P_d		90	135	mW	$I_O = 0\text{ A}$
Common Mode Rejection Ratio	CMR	85	90		dB	$R_S \leq 10\text{ k}\Omega$
Supply Voltage Rejection Ratio	SVR		30	75	$\mu\text{V/V}$	$R_S \leq 10\text{ k}\Omega$
Output Voltage Swing	V_{OM}	± 12.5	± 14		V	$R_L \geq 10\text{ k}\Omega$
Output Voltage Swing	V_{OM}	± 11	± 13		V	$R_L \geq 2\text{ k}\Omega$
Common Mode Input Voltage Range	V_{ICM}	± 13	± 14		V	
Slew Rate	SR		1.0		$\text{V}/\mu\text{s}$	$A_V = 1$
Input Equivalent Noise Voltage	V_n		6		μV_{p-p}	$R_S = 1\text{ k}\Omega, f = 1\text{ Hz} \sim 1\text{ kHz}$ (Fig 1)
Channel Separation			105		dB	$f = 1\text{ kHz}$ (Fig 2)

[Note] 6. The direction of the input bias current is the same direction that flows out from the IC because the first stage is composed of PNP transistor.

ELECTRICAL CHARACTERISTICS CURVE ($T_A = 25^\circ\text{C}$, TYP.) (REFERENCE VALUE)

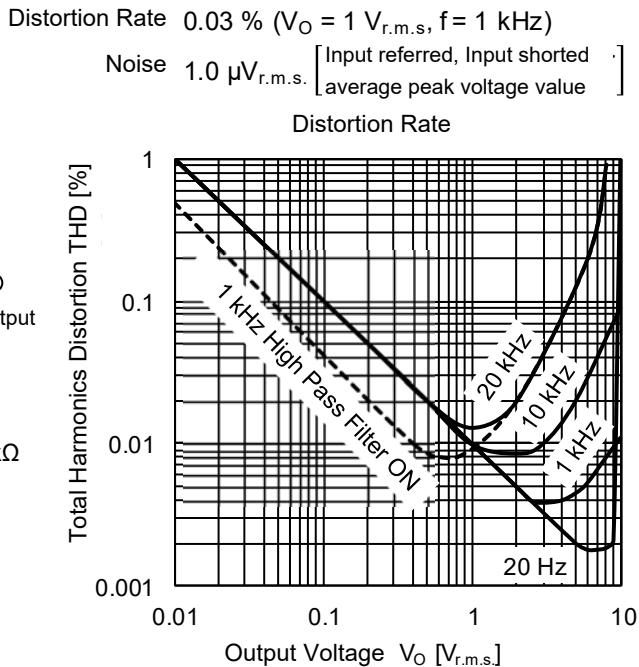

APPLICATION CIRCUIT

RIAA Pre-amplifier Av = 32.5 dB

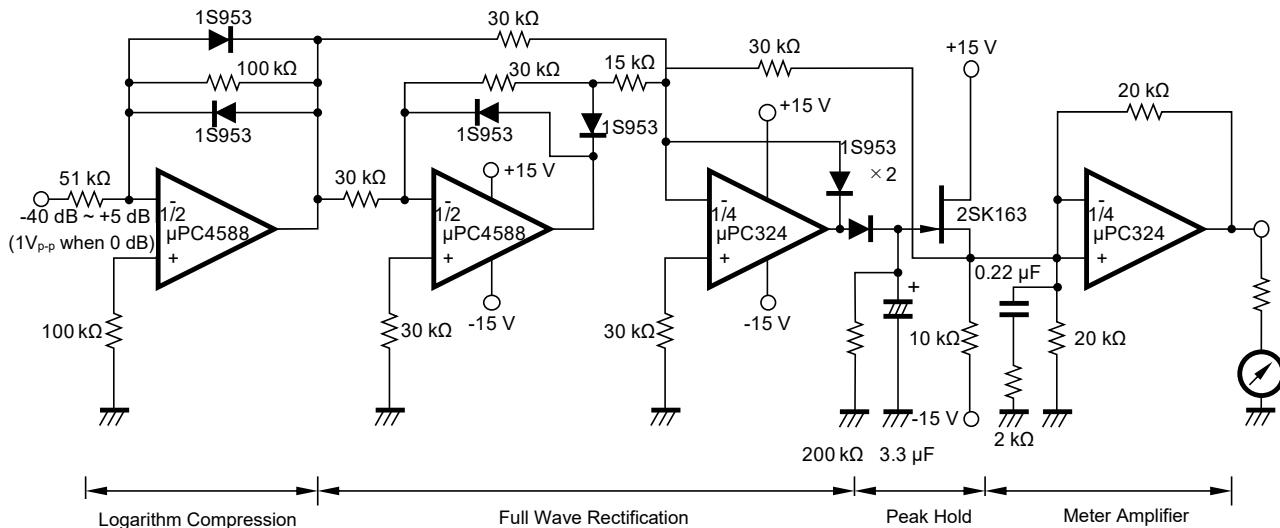

Standard Characteristics (Reference Value)

Peak Level Meter

This circuit converts the peak voltage (about $\pm 10 \text{ mV} \sim \pm 10 \text{ V}$) of the input signal to a DC voltage (about $0.2 \text{ V} \sim 1.3 \text{ V}$) and drives the meter.

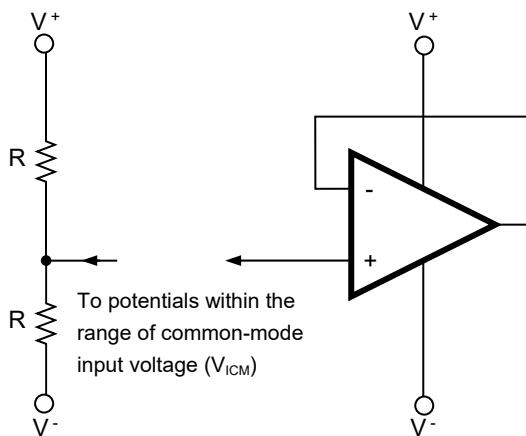

This output voltage is proportional to the logarithmic value of input peak voltage, thus providing a wider dynamic range indication compared to conventional linear indication methods.

USE WITH PRECAUTIONS

- Managing unused circuits
If there is an unused circuit, the following connection is recommended.

Example of handling unused circuit

Note in this example, an intermediate voltage of V^+ and V^- is applied.

- Power Supply (Dual Power Supply / Single Power Supply)**

The op amp operates when a predetermined voltage is applied between $V^+ - V^-$. Therefore, while it operates from a single power supply ($V^- = GND$), it is not possible to operate the input and output near GND. So please be careful of the common-mode input voltage range and maximum output voltage.

- Ratings of input/output pin voltage**

When the voltage of input/output pin exceeds the absolute maximum rating, the parasitic diode within the IC may conduct, causing characteristics degradation or damage. In addition, if the input pin is lower than V^- , or the output pin exceeds the power supply voltage, it is recommended to make a clamping circuit using a diode with low forward voltage (e.g.: Schottky diode) as protection.

- Range of common-mode input voltage**

When the supply voltage does not meet the condition of electrical characteristics, the range of common-mode input voltage is as follows.

$$V_{ICM} (\text{TYP.}) : V^- + 1 \sim V^+ - 1 [\text{V}] (\text{T}_A = 25^\circ\text{C})$$

During designing, do include some margin by considering characteristics variation, temperature characteristics etc.

- Maximum Output Voltage**

The TYP. value range of the maximum output voltage when the supply voltage does not meet the condition of electrical characteristics is as follows:

$$V_{om^+} (\text{TYP.}) : V^+ - 1 [\text{V}] (\text{T}_A = 25^\circ\text{C}), V_{om^-} (\text{TYP.}) : V^- + 1 [\text{V}] (\text{T}_A = 25^\circ\text{C})$$

During designing, do include some margin by considering characteristics variation, temperature characteristics and so on. In addition, also note that the output voltage range ($V_{om^+} - V_{om^-}$) will become narrow when the output current increases.

- Handling of ICs**

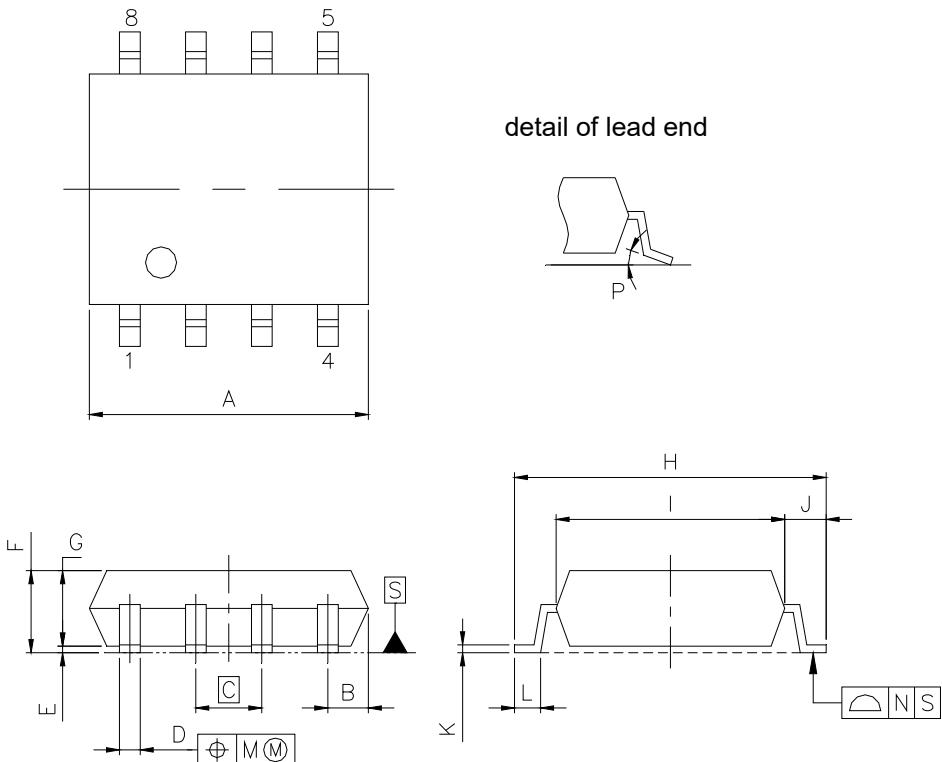

When stress is added to the ICs due to warpage or bending of a board, the characteristic may fluctuate due to piezoelectric (piezo) effect. Therefore, pay attention to warpage or bending of a board.
