## DESCRIPTION

The  $\mu$ PC259 and 4560 are dual operational amplifier with a built-in phase compensation circuit. The electrical characteristics are equivalent to the  $\mu$ PC258 and 4558, and can flow a large amount of output current. In addition, the slew rate is about 2.8 times of the  $\mu$ PC258, 4558.

Therefore, applications such as active filters, audio amplifiers and VCOs can be realized with a simple circuit configuration.

Depending on the operating ambient temperature,  $\mu$ PC259 is suitable for communication application while  $\mu$ PC4560 is suitable for general-purpose usage.

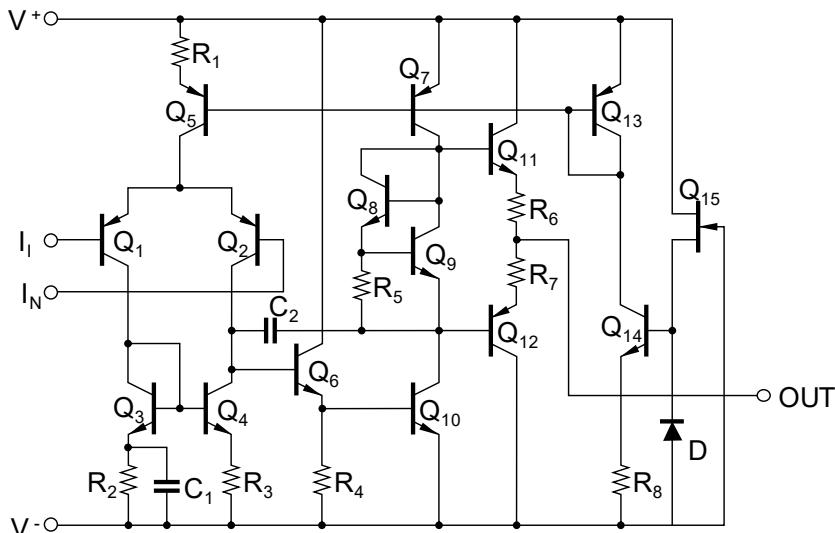

## FEATURES

- Input Offset Voltage  $\pm 0.5$  mV (TYP.)
- Input Offset Current  $\pm 5$  nA (TYP.)
- Input Bias Current 60 nA (TYP.)
- Slew Rate 2.8 V/ $\mu$ s (TYP.)
- Output Current over 25 mA
- Built-In Phase Compensation Circuit
- Standard Dual Op-Amp terminal connection (pin compatible)

- [Note]
1. Note that reverse connections of the power supply may damage the ICs.
  2. The input terminal must be apply within the input voltage range to avoid deteriorating or damaging the device characteristic. Do not exceed the ratings including during transition state such as ON/OFF, etc. The Op-Amp input voltage must operates within the electrical characteristics range of input common-mode voltage.
  3. The output terminal must be apply within the output voltage range to avoid deteriorating or damaging the device characteristic. Do not exceed the ratings including during transition state such as ON/OFF, etc. The Op-Amp output voltage must operates within the electrical characteristics range of maximum output voltage.
  4. This is the value at  $T_A \leq +25^\circ\text{C}$ . De-rate value at  $-4.4 \text{ mW}/^\circ\text{C}$  when  $T_A > 25^\circ\text{C}$ .
  5. Protection against load shorts is required. Please use the total loss and the de-rating value from Note 4.

## USE WITH PRECAUTIONS

- Managing unused circuits  
If there is an unused circuit, the following connection is recommended.

### Example of handling unused circuit

Note in this example, an intermediate voltage of  $V^+$  and  $V^-$  is applied.

- Power Supply (Dual Power Supply / Single Power Supply)**

The op amp operates when a predetermined voltage is applied between  $V^+ - V^-$ . Therefore, while it operates from a single power supply ( $V^- = GND$ ), it is not possible to operate the input and output near GND. So please be careful of the common-mode input voltage range and maximum output voltage.

- Ratings of input/output pin voltage**

When the voltage of input/output pin exceeds the absolute maximum rating, the parasitic diode within the IC may conduct, causing characteristics degradation or damage. In addition, if the input pin is lower than  $V^-$ , or the output pin exceeds the power supply voltage, it is recommended to make a clamping circuit using a diode with low forward voltage (e.g.: Schottky diode) as protection.

- Range of common-mode input voltage**

When the supply voltage does not meet the condition of electrical characteristics, the range of common-mode input voltage is as follows.

$$V_{ICM} (\text{TYP.}) : V^- + 1 \sim V^+ - 1 [\text{V}] (\text{T}_A = 25^\circ\text{C})$$

During designing, do include some margin by considering characteristics variation, temperature characteristics etc.

- Maximum Output Voltage**

The TYP. value range of the maximum output voltage when the supply voltage does not meet the condition of electrical characteristics is as follows:

$$V_{om^+} (\text{TYP.}) : V^+ - 1 [\text{V}] (\text{T}_A = 25^\circ\text{C}), V_{om^-} (\text{TYP.}) : V^- + 1 [\text{V}] (\text{T}_A = 25^\circ\text{C})$$

During designing, do include some margin by considering characteristics variation, temperature characteristics and so on. In addition, also note that the output voltage range ( $V_{om^+} - V_{om^-}$ ) will become narrow when the output current increases.

- Handling of ICs**

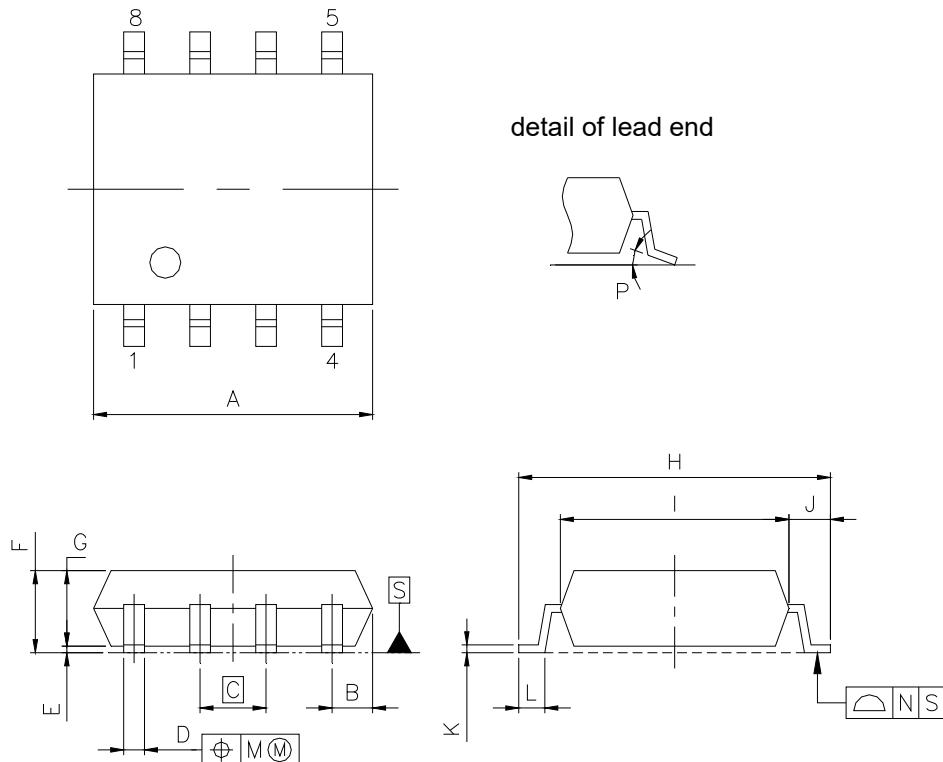

When stress is added to the ICs due to warpage or bending of a board, the characteristic may fluctuate due to piezoelectric (piezo) effect. Therefore, pay attention to warpage or bending of a board.
