

#### **Overview**

KEMET's VE series of high temperature, low voltage varistors are designed to protect sensitive electronic devices against high voltage surges in the low voltage region. In addition to superior operating performance at rated 150°C (AEC-Q200 compliance) they offer excellent transient energy absorption due to improved energy volume distribution and power dissipation.

## **Applications**

Typical applications include transient over-voltage protection in automotive assembly motors and controllers as well as surge protection of non-automotive electronic products exposed to over-heating, i.e., consumer, telecommunication or industrial.

Load dump and jump start protection of 12 to 24 V supply systems. Protection of integrated circuits and other components at the circuit board level including the suppression of inductive switching or other transient events such as surge voltage. ESD protection for components sensitive to IEC 1000-4-2, MILSTD 883C Method 3015.7 and other industry spec. Replacement of larger surface mount TVS Zeners in many applications. Designed to achieve electromagnetic compliance of end products and provide on-board transient voltage protection of ICs and transistors.

#### **Benefits**

- AEC-Q200 qualified Grade 1
- Surface mount form factor
- Operating ambient temperature of -55°C to +150°C
- Superior operating performance rated at 150°C (AEC-Q200 compliance)
- Operating voltage range of 11 170 V
- AC voltage range (V<sub>rms</sub>) of 8 130 V
- High resistance to cyclic temperature stress
- · Low leakage currents after 1,000 hours rated at 150°C
- High energy absorption capability
- Available case sizes: 0603, 0805, 1206, 1210, 1812, 2220
- · Short response time
- · Broad range of current and energy handling capabilities
- Low clamping voltage Uc
- · Non-sensitive to mildly activated fluxes
- Barrier type end terminations solderable with Pb-free solders according to JEDEC J-STD-020C and IEC 60068-2-58
- RoHS 2 2011/65/EC, REACH compliant

## Qualifications

Reliability Parameter	Test	Tested According to	Condition to be Satisfied after Testing
AC/DC Bias Reliability	AC/DC Life Test	CECC 42200, Test 4.20 or IEC 1051-1, Test 4.20. AEC-Q200 Test 8 - 1,000 hours at UCT	δ <sub>vn</sub> (1 mA)  < 10%
Pulse Current Capability	I <sub>max</sub> 8/20 μs	CECC 42200, Test C 2.1 or IEC 1051–1, Test 4.5. 10 pulses in the same direction at 2 pulses per minute at maximum peak current for 10 pulses	δ <sub>vn</sub> (1 mA)  < 10% no visible damage
Pulse Energy Capability	W <sub>max</sub> 10/1,000 μs	CECC 42200, Test C 2.1 or IEC 1051–1, Test 4.5. 10 pulses in the same direction at 1 pulses every 2 minutes at maximum peak current for 10 pulses	δ <sub>vn</sub> (1 mA)  < 10% no visible damage
WLD Capability	WLD x 10	ISO 7637, Test pulse 5, 10 pulses at rate 1 per minute	δ <sub>vn</sub> (1 mA)  < 15% no visible damage
V <sub>jump</sub> Capability	$V_{jump}$ 5 minutes	Increase of supply voltage to $V \ge V_{jump}$ for 1 minute	δ <sub>vn</sub> (1 mA)  < 15% no visible damage

## Qualifications cont.

Reliability Parameter	Test	Tested According to	Condition to be Satisfied after Testing
Environmental and	Climatic Sequence	CECC 42200, Test 4.16 or IEC 1051–1, Test 4.17. a) Dry heat, 16 hours, UCT, Test Ba, IEC 68–2–2 b) Damp heat, cyclic, the first cycle: 55°C, 93% RH, 24 hours, Test Db 68–2–4 c) Cold, LCT, 2 hours Test Aa IEC 68–2–1 d) Damp heat cyclic, remaining 5 cycles: 55°C, 93% RH, 24 hour/cycle, Test Bd, IEC 68–2–30	δ <sub>νn</sub> (1 mA)  < 10%
Storage Reliability	Thermal Shock	CECC 42200, Test 4.12, Test Na, IEC 68-2-14, AEC-Q200 Test 16, 5 cycles UCT/LCT, 30 minutes	δ <sub>vn</sub> (1 mA)  < 10% no visible damage
	Steady State Damp Heat	CECC 42200, Test 4.17, Test Ca, IEC 68–2–3, AEC–Q200 Test 6, 56 days, 40°C, 93% RH. AEC–Q200 Test 7: Bias, RH, T all at 85.	δ <sub>ν1</sub> (1 mA)  < 10%
	Storage Test	IEC 68–2–2, Test Ba, AEC–Q200 Test 3, 1,000 hours at maximum storage temperature	δ <sub>vn</sub> (1 mA)  < 5%
	Solderability	CECC 42200, Test 4.10.1, Test Ta IEC 68–2–20 solder bath and reflow method	Solderable at shipment and after 1 year of storage, criteria > 95% must be covered by solder for reflow meniscus
	Resistance to Soldering Heat	CECC 42200, Test 4.10.2, Test Tb, IEC 68–2–20 solder bath and reflow method	δ <sub>vn</sub> (1 mA)  < 5%
	Terminal Strength	JIS-C-6429, App. 1, 18 N for 60 seconds – same for AEC-Q200 Test 22	no visual damage
	Board Flex	JIS-C-6429, App. 2, 2 mm minimum AEC-Q200 test 21 – Board flex: 2 mm flex minimum	δ <sub>vn</sub> (1 mA)  < 2% no visible damage
Mechanical Reliability	Vibration	CECC 42200, Test 4.15, Test Fc, IEC 68-2-6, AEC-Q200 Test 14. Frequency range 10 - 55 Hz (AEC: 10 - 2,000 Hz) Amplitude 0.75 m/s <sup>2</sup> or 98 m/s <sup>2</sup> (AEC: 5 G for 20 minutes) Total duration 6 hours (3 x 2 hours) (AEC: 12 cycles each of 3 directions) Waveshape - half sine	δ <sub>vn</sub> (1 mA)  < 10% no visible damage
	Mechanical Shock	CECC 42200, Test 4.14, Test Ea, IEC 68–2–27, AEC–Q200 Test 13. Acceleration = 490 m/s <sup>2</sup> (AEC: MIL-STD–202–Method 213), Pulse duration = 11 ms, Waveshape – half sine; Number of shocks = 3 x 6	δ <sub>νn</sub> (1 mA)  < 10% no visible damage
Electrical Transient Conduction	ISO-7637-1 Pulses	AEC-Q200 Test 30: Test pulses 1 to 3. Also other pulses – freestyle.	δ <sub>vn</sub> (1 mA)  < 10% no visible damage

## Reliability

In general, reliability is the ability of a component to perform and maintain its functions in routine circumstances, as well as

hostile or unexpected circumstances. The mean life of series components is a function of:

- Factor of Applied Voltage
- Ambient temperature

Mean life is closely related to Failure rate (formula).

Mean life (ML) is the arithmetic mean (average) time to failure of a component.

Failure rate is the frequency with which an engineered system or component fails, expressed for example in failures per hour. Failure rate is usually time dependent, an intuitive corollary is that the rate changes over time versus the expected life cycle of a system.

Failure rate formula – calculation

$$\Lambda = \frac{10^9}{ML[h]} \quad [fit]$$

FAV – Factor of Applied Voltage

$$\Lambda = \frac{Vapl}{V_{max}}$$

Vapl = applied voltage

 $V_{max}$  = maximum operating voltage

## Soldering

Popular soldering techniques used for surface mounted components are Wave and Infrared Reflow processes. Both processes can be performed with Pb-containing or Pb-free solders. The termination option available for these soldering techniques is Barrier Type End Terminations.

End Termination	Designation	Recommended and Suitable for	Component RoHS Compliant
Ni Sn Barrier Type End Termination	Ni R1	Pb-containing and Pb-free soldering	Yes

**Wave Soldering** – this process is generally associated with discrete components mounted on the underside of printed circuit boards, or for large top-side components with bottom-side mounting tabs to be attached, such as the frames of transformers, relays, connectors, etc. SMD variators to be wave soldered are first glued to the circuit board, usually with an epoxy adhesive. When all components on the PCB have been positioned and an appropriate time is allowed for adhesive curing, the completed assembly is then placed on a conveyor and run through a single, double wave process.

**Infrared Reflow Soldering** – these reflow processes are typically associated with top-side component placement. This technique utilizes a mixture of adhesive and solder compounds (and sometimes fluxes) that are blended into a paste. The paste is then screened onto PCB soldering pads specifically designed to accept a particular sized SMD component. The recommended solder paste wet layer thickness is 100 to 300 µm. Once the circuit board is fully populated with MD components, it is placed in a reflow environment, where the paste is heated to slightly above its eutectic temperature. When the solder paste reflows, the SMD components are attached to the solder pads.

**Solder Fluxes** – solder fluxes are generally applied to populated circuit boards to clean oxides forming during the heating process and to facilitate the flowing of the solder. Solder fluxes can be either a part of the solder paste compound or can be separate materials, usually fluids. Recommended fluxes are:

- Non-activated (R) fluxes, whenever possible
- Mildly activated (RMA) fluxes of class L3CN
- Class ORLO

Activated (RA), water soluble or strong acidic fluxes with a chlorine content > 0.2 wt. % are NOT RECOMMENDED. The use of such fluxes could create high leakage current paths along the body of the varistor components.

When a flux is applied prior to wave soldering, it is important to completely dry any residual flux solvents prior to the soldering process.

**Thermal Shock** – to avoid the possibility of generating stresses in the varistor chip due to thermal shock, a preheat stage to within 100°C of the peak soldering process temperature is recommended. Additionally, SMD varistors should not be subjected to a temperature gradient greater than 4°C/second, with an ideal gradient being 2°C/second. Peak temperatures should be controlled. Wave and Reflow soldering conditions for SMD varistors with Pb-containing solders are shown in Fig. 1 and 2 respectively, while Wave and Reflow soldering conditions for SMD varistors with Pb-free solders are shown in Figures 1 and 3

## Soldering cont.

Whenever several different types of SMD components are being soldered, each having a specific soldering profile, the soldering profile with the least heat and the minimum amount of heating time is recommended. Once soldering has been completed, it is necessary to minimize the possibility of thermal shock by allowing the hot PCB to cool to less than 50°C before cleaning.

**Inspection Criteria** – the inspection criteria to determine acceptable solder joints, when Wave or Infrared Reflow processes are used, will depend on several key variables, principally termination material process profiles.

**Pb-contining Wave and IR Reflow Soldering** – typical "before" and "after" soldering results for Barrier Type End Terminations can be seen in Fig. 4. Barrier type terminated varistors form a reliable electrical contact and metallurgical bond between the end terminations and the solder pads. The bond between these two metallic surfaces is exceptionally strong and has been tested by both vertical pull and lateral (horizontal) push tests. The results exceed established industry standards for adhesion.

The solder joint appearance of a barrier type terminated varistor shows that solder forms a metallurgical junction with the thin tin-alloy (over the barrier layer), and due to its small volume "climbs" the outer surface of the terminations, the meniscus will be slightly lower. This optical appearance should be taken into consideration when programming visual inspection of the PCB after soldering.

#### Ni Sn Barrier Type End Terminations

Figure 4: Soldering Criterion in case of Wave and IR Reflow Pb-containing Soldering

**Pb-free Wave and IR Reflow Soldering** – typical "before" and "after" soldering results for Barrier Type End Terminations are given in a phenomenon knows as "mirror" or "negative" meniscus. Solder forms a metallurgical junction with the entire volume of the end termination, i.e. it diffuses from pad to end termination across the inner side, forming a "mirror" or "negative" meniscus. The height of the solder penetration can be clearly seen on the end termination and is always 30% higher than the chip height.

## Soldering cont.

**Solder Test and Retained Samples** – reflow soldering test based on J-STD-020D.1 and soldering test by dipping based on IEC 60068-2 for Pb-free solders are preformed on each production lot as shown in the following chart. Test results and accompanying samples are retained for a minimum of two (2) years. The solderability of a specific lot can be checked at any time within this period should a customer require this information.

Test	Resistance to Flux	Solderability	Static leaching (Simulation of Reflow Soldering)	Dynamic Leaching (Simulation of Wave Soldering)
Parameter				
Soldering method	Dipping	Dipping	Dipping	Dipping with agitation
Flux	L3CN, ORLO	L3CN, ORLO, R	L3CN, ORLO, R	L3CN, ORLO, R
Pb Solder	62 Sn/36 Pb/2 Ag			
Pb Soldering temperature (°C)	235±5	235±5	260±5	235±5
Pb-FREE Solder	Sn96/Cu0,4-0,8/3-4Ag			
Pb-FREE Soldering Temperature (°C)	250±5	250±5	280±5	250±5
Soldering Time (s)	2	210	10	> 15
Burn-in Conditions	VDC <sub>max</sub> , 48 h			
Acceptance Criterion	dVn < 5%, i <sub>dc</sub> must stay unchanged	> 95% of end termination must be covered by solder	> 95% of end termination must be intact and covered by solder	> 95% of end termination must be intact and covered by solder

**Rework Criteria Soldering Iron** – unless absolutely necessary, the use of soldering irons is NOT recommended for reworking varistor chips. If no other means of rework is available, the following criteria must be strictly followed:

• Do not allow the tip of the iron to directly contact the top of the chip

Do not exceed the following soldering iron specifications:						
Output Power:	30 Watts maximum					
Temperature of Soldering Iron Tip:	280°C maximum					
Soldering Time:	10 Seconds maximum					

**Storage Conditions** – SMD varistors should be used within 1 year of shipment from factory to avoid possible soldering problems caused by oxidized terminals. The storage environment should be controlled, with humidity less than 40% and temperature between -25 and 45 °C. Varistor chips should always be stored in their original packaged unit.

## **Terms and Definitions**

Term	Symbol	Definition	
Rated AC Voltage	V <sub>rms</sub>	Maximum continuous sinusoidal AC voltage (< 5% total harmonic distortion) which may be applied to the component under continuous operation conditions at 25°C	
Rated DC Voltage	V <sub>dc</sub>	Maximum continuous DC voltage (< 5% ripple) which may be applied to the component under continuous operating conditions at 25°C	
Supply Voltage	V	The voltage by which the system is designated and to which certain operating characteristic the system are referred; $V_{rms} = 1, 1 \times V$	
Leakage Current	I <sub>dc</sub>	The current passing through the varistor at Vdc and at 25°C or at any other specified temperature	
Varistor Voltage	V <sub>n</sub>	Voltage across the varistor measured at a given reference current In	
Reference Current	l <sub>n</sub>	Reference current = 1 mA DC	
Clamping Voltage Protection Level	V <sub>c</sub>	The peak voltage developed across the varistor under standard atmospheric conditions, when passing an 8/20 µs class current pulse	
Class Current	ا <sub>د</sub>	A peak value of current which is 1/10 of the maximum peak current for 100 pulses at two per minute for the 8/20 µs pulse	
Voltage Clamping Ratio	$V_{c}/V_{app}$	A figure of merit measure of the varistor clamping effectiveness as defined by the symbols $V_c/V_{app}$ , where $(V_{app} = V_{rms} \text{ or } V_{dc})$	
Jump Start Transient	$V_{jump}$	The jump start transient resulting from the temporary application of an overvoltage in excess of the rated battery voltage. The circuit power supply may be subjected to a temporary overvoltage condition due to the voltage regulation failing or it may be deliberately generated when it becomes necessary to boost start the car	
Rated Single Pulse Transient Energy	W <sub>max</sub>	Energy which may be dissipated for a single 10/1,000 µs pulse of a maximum rated current, with rated AC voltage or rated DC voltage also applied, without causing device failure	
Load Dump Transient	WLD	Load Dump is a transient which occurs in an automotive environment. It is an exponentially decaying positive voltage which occurs in the event of a battery disconect while the alternator is still generating charging current with other loads remaining on the alternator circuit at the time of battery disconect	
Rated Peak Single Pulse Transient Current	I <sub>max</sub>	Maximum peak current which may be applied for a single 8/20 μs pulse, with, rated line voltage also applies, without causing device failure	
Rated Transient Average Power Dissipation	Ρ	Maximum average power which may be dissipated due to a group of pulses occurring within a specified isolated time period, without causing device failure at 25°C	
Capacitance	С	Capacitance between two terminals of the varistor measured at 1 kHz	
Response Time	tr	The time lag between application of a surge and varistor's "turn-on" conduction action	
Varistor Voltage Temperature Coefficient	TC	(V <sub>n</sub> at 85°C – V <sub>n</sub> at 25°C)/(V <sub>n</sub> at 25°C) x 60°C) x 100	
Insulation Resistance	IR	Minimum resistance between shorted terminals and varistor surface	
Isolation		The maximum peak voltage which may be applied under continuous operating conditions	
Voltage		between the varistor terminations and any conducting mounting surface	
Operating Temperature		The range of ambient temperature for which the varistor is designed to operate continuously as defined by the temperature limits of its climatic category	
Temperature		UCT = Upper Category Temperature – the maximum ambient temperature for which a varistor	
Climatic Category	LCT/UCT/DHD	has been designed to operate continuously, LCT = Lower Category Temperature – the minimum ambient temperature at which a varistor has been designed to operate continuously DHD = Dump Heat Test Duration	
Storage Temperature		Storage temperature range without voltage applied
