

X9259

Single Supply/Low Power/256-Tap/2-Wire Bus Quad Digitally-Controlled (XDCP™) Potentiometers

FN8169
Rev 6.00
December 12, 2014

The X9259 integrates four digitally controlled potentiometers (XDCP) on a monolithic CMOS integrated circuit.

The digitally controlled potentiometers are implemented with a combination of resistor elements and CMOS switches. The position of the wipers are controlled by the user through the 2-wire bus interface. Each potentiometer has associated with it a volatile Wiper Counter Register (WCR) and four nonvolatile Data Registers that can be directly written to and read by the user. The content of the WCR controls the position of the wiper. At power-up, the device recalls the content of the default Data Registers of each DCP (DR00, DR10, DR20, and DR30) to the corresponding WCR.

The XDCP can be used as a three-terminal potentiometer or as a two-terminal variable resistor in a wide variety of applications including control, parameter adjustments, and signal processing.

Features

- Four separate potentiometers in one package
- 256 resistor taps–0.4% resolution
- 2-wire serial interface for write, read, and transfer operations of the potentiometer
- Wiper resistance: 100Ω typical at V_{CC} = 5V
- 4 nonvolatile data registers for each potentiometer
- Nonvolatile storage of multiple wiper positions
- Standby current <5μA max
- V_{CC}: 2.7V to 5.5V operation
- 50kΩ version of total resistance
- Endurance: 100,000 data changes per bit per register
- 100 year data retention
- Single supply version of X9258
- 24 Ld SOIC, 24 Ld TSSOP
- Low power CMOS
- Pb-Free (RoHS compliant)

NOTES:

- Intersil Pb-free plus anneal products employ special Pb-free material sets; molding compounds/die attach materials and 100% matte tin plate termination finish, which are RoHS compliant and compatible with both SnPb and Pb-free soldering operations. Intersil Pb-free products are MSL classified at Pb-free peak reflow temperatures that meet or exceed the Pb-free requirements of IPC/JEDEC J STD-020.
- Add "T1" suffix for tape and reel.
- For Moisture Sensitivity Level (MSL), please see product information page for [X9259](#). For more information on MSL, please see tech brief [TB363](#).

Circuit Level Applications

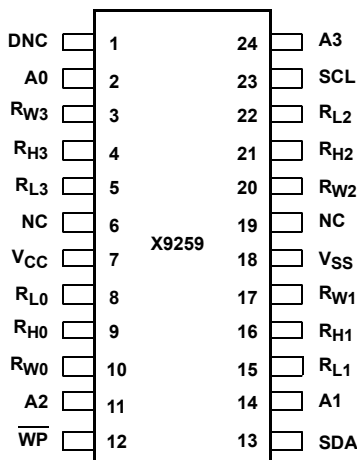

- Vary the gain of a voltage amplifier
- Provide programmable DC reference voltages for comparators and detectors
- Control the volume in audio circuits
- Trim out the offset voltage error in a voltage amplifier circuit
- Set the output voltage of a voltage regulator
- Trim the resistance in Wheatstone bridge circuits
- Control the gain, characteristic frequency and Q-factor in filter circuits
- Set the scale factor and zero point in sensor signal conditioning circuits
- Vary the frequency and duty cycle of timer ICs
- Vary the DC biasing of a pin diode attenuator in RF circuits
- Provide a control variable (I, V, or R) in feedback circuits

System Level Applications

- Adjust the contrast in LCD displays
- Control the power level of LED transmitters in communication systems
- Set and regulate the DC biasing point in an RF power amplifier in wireless systems
- Control the gain in audio and home entertainment systems
- Provide the variable DC bias for tuners in RF wireless systems
- Set the operating points in temperature control systems
- Control the operating point for sensors in industrial systems
- Trim offset and gain errors in artificial intelligent systems

23	SCL	Serial Clock for 2-wire bus.
24	A3	Device Address for 2-wire bus. (See Note 4)
6, 19	NC	No Connect
1	DNC	Do Not Connect

NOTE:

- A0 through A3 Device address pins must be tied to a logic level.

Functional Pin Descriptions

Bus Interface Pins

SERIAL DATA INPUT/OUTPUT (SDA)

The SDA is a bidirectional serial data input/output pin for a 2-wire slave device and is used to transfer data into and out of the device. It receives device address, opcode, wiper register address and data sent from a 2-wire master at the rising edge of the serial clock SCL, and it shifts out data after each falling edge of the serial clock SCL.

It is an open-drain output and may be wire-ORed with any number of open drain or open collector outputs. An open-drain output requires the use of a pull-up resistor.

SERIAL CLOCK (SCL)

This input is used by a 2-wire master to supply a 2-wire serial clock to the X9259.

DEVICE ADDRESS (A3 THROUGH A0)

The Address inputs are used to set the least significant 4 bits of the 8-bit slave address. A match in the slave address serial data stream must be made with the address input in order to initiate communication with the X9259. A maximum of 16 devices may occupy the 2-wire serial bus. Device pins A3 through A0 must be tied to a logic level, which specifies the external address of the device, see [Figures 3, 4, and 5](#).

Potentiometer Pins

R_H, R_L

The R_H and R_L pins are equivalent to the terminal connections on a mechanical potentiometer. Since there are 4 potentiometers, there are 4 sets of R_H and R_L such that R_{H0} and R_{L0} are the terminals of DCP0 and so on.

R_W

The wiper pin are equivalent to the wiper terminal of a mechanical potentiometer. Since there are 4 potentiometers, there are 4 sets of R_W such that R_{W0} is the terminal of DCP0 and so on.

Bias Supply Pins

SYSTEM SUPPLY VOLTAGE (V_{CC}) AND SUPPLY GROUND (V_{SS})

The V_{CC} pin is the system supply voltage. The V_{SS} pin is the system ground.

Other Pins

NO CONNECT

No connect pins should be left open. These pins are used for Intersil manufacturing and testing purposes.

HARDWARE WRITE PROTECT INPUT (\overline{WP})

The \overline{WP} pin when LOW, prevents nonvolatile writes to the Data Registers.

One of Four Potentiometers

#: 0, 1, 2, or 3

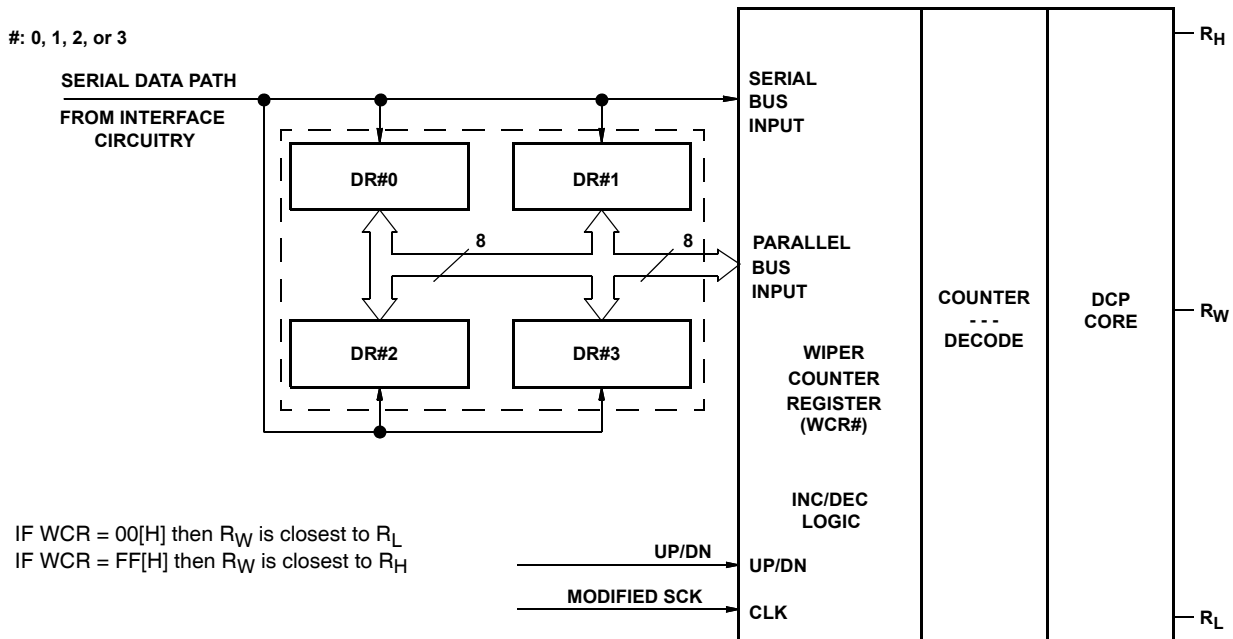

FIGURE 1. DETAILED POTENTIOMETER BLOCK DIAGRAM

Principles of Operation

The X9259 is an integrated circuit incorporating four DCPs and their associated registers and counters, and the serial interface providing direct communication between a host and the potentiometers.

DCP Description

Each DCP is implemented with a combination of resistor elements and CMOS switches. The physical ends of each DCP are equivalent to the fixed terminals of a mechanical potentiometer (R_H and R_L pins). The RW pin is an intermediate node, equivalent to the wiper terminal of a mechanical potentiometer.

The position of the wiper terminal within the DCP is controlled by an 8-bit volatile Wiper Counter Register (WCR).

Power Up and Down Recommendations

There are no restrictions on the power-up or power-down conditions of V_{CC} and the voltages applied to the potentiometer pins provided that V_{CC} is always more positive than or equal to V_H , V_L , and V_W , i.e., $V_{CC} \geq V_H, V_L, V_W$. The V_{CC} ramp rate specification is always in effect.

Wiper Counter Register (WCR)

The X9259 contains four Wiper Counter Registers, one for each potentiometer. The Wiper Counter Register can be envisioned as a 8-bit parallel and serial load counter with its outputs decoded to select one of 256 wiper positions along its resistor array. The contents of the WCR can be altered in four ways: it may be written directly by the host via the Write Wiper Counter Register instruction (serial load); it may be written indirectly by

transferring the contents of one of four associated data registers via the XFR Data Register instruction (parallel load); it can be modified one step at a time by the Increment/Decrement instruction (see "[Instructions](#)" section on [page 8](#) for more details). Finally, it is loaded with the contents of its data register zero (DR#0) upon power-up, (see [Figure 1 on page 4](#)).

The Wiper Counter Register is a volatile register; that is, its contents are lost when the X9259 is powered-down. Although the register is automatically loaded with the value in DR#0 upon power-up, this may be different from the value present at power-down. Power-up guidelines are recommended to ensure proper loadings of the DR#0 value into the WCR# (see [AN162](#)).

Data Registers (DR)

Each of the four DCPs has four 8-bit nonvolatile Data Registers. These can be read or written directly by the host. Data can also be transferred between any of the four data registers and the associated Wiper Counter Register. All operations changing data in one of the data registers is a nonvolatile operation and takes a maximum of 10ms.

If the application does not require storage of multiple settings for the potentiometer, the Data Registers can be used as regular memory locations for system parameters or user preference data.

Bit [7:0] are used to store one of the 256 wiper positions (0 ~ 255).

TABLE 1. WIPER COUNTER REGISTER, WCR (8-BIT), WCR[7:0]: USED TO STORE THE CURRENT WIPER POSITION (VOLATILE).

(MSB)							(LSB)

Serial Interface

The X9259 supports a bidirectional bus oriented protocol. The protocol defines any device that sends data onto the bus as a transmitter and the receiving device as the receiver. The device controlling the transfer is a master and the device being controlled is the slave. The master always initiates data transfers and provide the clock for both transmit and receive operations. Therefore, the X9259 operates as a slave device in all applications.

All 2-wire interface operations must begin with a START, followed by an Identification Byte, that selects the X9259. All communication over the 2-wire interface is conducted by sending the MSB of each byte of data first.

Clock and Data Conventions

Data states on the SDA line can change only during SCL LOW periods. SDA state changes during SCL HIGH are reserved for indicating START and STOP conditions (see [Figure 2](#)). On power-up of the X9259, the SDA pin is in the input mode.

START Condition

All commands to the X9259 are preceded by the start condition, which is a HIGH to LOW transition of SDA while SCL is HIGH. The X9259 continuously monitors the SDA and SCL lines for the START condition and does not respond to any command until this condition is met (see [Figure 2](#)).

STOP Condition

All communications must be terminated by a STOP condition, which is a LOW to HIGH transition of SDA while SCL is HIGH, (see [Figure 2](#)). The STOP condition is also used to place the device into the Standby Power mode after a Read sequence. A STOP

condition can only be issued after the transmitting device has released the bus.

Acknowledge

An ACK, Acknowledge, is a software convention used to indicate a successful data transfer. The transmitting device, either master or slave, releases the SDA bus after transmitting eight bits. During the ninth clock cycle, the receiver pulls the SDA line LOW to acknowledge the reception of the eight bits of data, (see [Figure 3](#)).

The X9259 responds with an ACK after recognition of a START condition followed by a valid Identification Byte, and once again after successful receipt of an Instruction Byte. The X9259 also responds with an ACK after receiving a Data Byte after a Write Instruction.

A valid Identification Byte contains the Device Type Identifier 0101, as the four MSBs, and the Device Address bits matching the logic states of pins A3, A2, A1, and A0, as the four LSBs (see [Figure 4 on page 8](#)).

In the Read mode, the device transmits eight bits of data, releases the SDA line, and then monitors the line for an ACK. The device continues transmitting data if an ACK is detected. The device terminates further data transmissions if an ACK is not detected. The master must then issue a STOP condition to place the device into a known state.

During the internal nonvolatile Write operation, the X9259 ignores the inputs at SDA and SCL, and does not issue an ACK after Identification bytes.

FIGURE 2. VALID DATA CHANGES, START, AND STOP CONDITIONS

FIGURE 3. ACKNOWLEDGE RESPONSE FROM RECEIVER

Identification Byte

The first byte sent to the X9259 from the host is called the Identification Byte. The most significant four bits are a Device Type Identifier, ID[3:0] bits, which must be 0101. Refer to [Table 3](#).

Only the device which Slave Address matches the incoming device address sent by the master executes the instruction. The A3 - A0 inputs can be actively driven by CMOS input signals or tied to V_{CC} or V_{SS}.

INSTRUCTION BYTE (I)

The next byte sent to the X9259 contains the instruction and register pointer information. The four most significant bits are used provide the instruction opcode I [3:0]. The RB and RA bits point to one of the four data registers of each associated XDCCP.

The least two significant bits point to one of four Wiper Counter Registers or DCPs. The format is shown in [Table 4](#).

Data Register Selection

REGISTER	RB	RA
DR#0	0	0
DR#1	0	1
DR#2	1	0
DR#3	1	1

#: 0, 1, 2, or 3

The least significant four bits of the Identification Byte are the Slave Address bits, AD[3:0]. To access the X9259, these four bits must match the logic values of pins A3, A2, A1, and A0.

Global XFR Data Registers to Wiper Counter Registers	0	0	0	1	1/0	1/0	0	0	Transfer the contents of the Data Registers pointed to by RB - RA of all four pots to their respective Wiper Counter Registers
Global XFR Wiper Counter Registers to Data Register	1	0	0	0	1/0	1/0	0	0	Transfer the contents of both Wiper Counter Registers to their respective data Registers pointed to by RB - RA of all four DCPs
Increment/Decrement Wiper Counter Register	0	0	1	0	0	0	1/0	1/0	Enable Increment/decrement of the Control Latch pointed to by P1 - P0

NOTE: 1/0 = data is one or zero

Instructions

Four of the nine instructions are three bytes in length. These instructions are:

- **Read Wiper Counter Register** – read the current wiper position of the selected potentiometer.
- **Write Wiper Counter Register** – change current wiper position of the selected potentiometer.
- **Read Data Register** – read the contents of the selected Data Register.
- **Write Data Register** – write a new value to the selected Data Register.

The basic sequence of the three byte instructions is illustrated in [Figure 5](#). These three-byte instructions exchange data between the WCR and one of the Data Registers. A transfer from a Data Register to a WCR is essentially a write to a static RAM, with the static RAM controlling the wiper position. The response of the wiper to this action is delayed by t_{WRL} . A transfer from the WCR (current wiper position), to a Data Register is a write to nonvolatile memory and takes a minimum of t_{WR} to complete. The transfer can occur between one of the four potentiometer's WCR, and one of its associated registers, DRs; or it may occur globally, where the transfer occurs between all potentiometers and one associated register.

Four instructions require a two-byte sequence to complete. These instructions transfer data between the host and the X9259; either between the host and one of the data registers or directly

between the host and the Wiper Counter Register. These instructions are:

- **XFR Data Register to Wiper Counter Register** – This transfers the contents of one specified Data Register to the associated Wiper Counter Register.
- **XFR Wiper Counter Register to Data Register** – This transfers the contents of the specified Wiper Counter Register to the specified associated Data Register.
- **Global XFR Data Register to Wiper Counter Register** – This transfers the contents of all specified Data Registers to the associated Wiper Counter Registers.
- **Global XFR Wiper Counter Register to Data Register** – This transfers the contents of all Wiper Counter Registers to the specified associated Data Registers.

Increment/Decrement Command

The final command is Increment/Decrement ([Figures 6 and 7](#)). The Increment/Decrement command is different from the other commands. Once the command is issued and the X9259 has responded with an Acknowledge, the master can clock the selected wiper up and/or down in one segment steps; thereby, providing a fine tuning capability to the host. For each SCL clock pulse (t_{HIGH}) while SDA is HIGH, the selected wiper moves one wiper position towards the R_H terminal. Similarly, for each SCL clock pulse while SDA is LOW, the selected wiper moves one resistor wiper position towards the R_L terminal.

See ["Instruction Format" on page 10](#) for more details.

NOTES:

5. "MACK"/"SACK": stands for the acknowledge sent by the Master/Slave.
6. "A3 ~ A0": stands for the device addresses sent by the master.
7. "X": indicates that it is a "0" for testing purpose but physically it is a "don't care" condition.
8. "I": stands for the increment operation, SDA held high during active SCL phase (high).
9. "D": stands for the decrement operation, SDA held low during active SCL phase (high).

Absolute Maximum Ratings

Temperature under bias	-65°C to +135°C
Storage temperature	-65°C to +150°C
Voltage on SCL, SDA, any address input, V _{CC} with respect to V _{SS}	-1V to +7V
$\Delta V = V_H - V_L $	5.5V
Lead temperature (soldering, 10 seconds)	300°C
I _W (10 seconds)	±6mA

Recommended Operating Conditions

Temperature (Commercial)	0°C to +70°C
Temperature (Industrial)	-40°C to +85°C
Supply Voltage (V _{CC}) (Note 13) Limits	
X9259	5V ± 10%
X9259-2.7	2.7V to 5.5V
Wiper current	±3mA
Power rating (each pot)	50mW
Pb-Free Reflow Profile	see TB493

CAUTION: Do not operate at or near the maximum ratings listed for extended periods of time. Exposure to such conditions may adversely impact product reliability and result in failures not covered by warranty.

Analog Specifications

 Over recommended industrial (2.7V) operating conditions unless otherwise stated.

SYMBOL	PARAMETER	TEST CONDITIONS	LIMITS			
			MIN	TYP	MAX	UNITS
R _{TOTAL}	End-to-End Resistance	U version		50		kΩ
	End-to-End Resistance Tolerance				±20	%

	Ratiometric Temp. Coefficient (Note 15)			±20		ppm/°C
C _H /C _L /C _W	Potentiometer Capacitances (Note 15)	See SPICE Macromodel on page 14 .		10/10/25		pF

NOTES:

- Absolute linearity is utilized to determine actual wiper voltage versus expected voltage as determined by wiper position when used as a potentiometer.
- Relative linearity is utilized to determine the actual change in voltage between two successive tap positions when used as a potentiometer. It is a measure of the error in step size.
- MI = RTOT / 255 or (R_H - R_L) / 255, single pot
- During power up V_{CC} > V_H, V_L, and V_W.
- n = 0, 1, 2, ..., 255; m = 0, 1, 2, ..., 254.

DC Electrical Specifications Over the recommended operating conditions unless otherwise specified.

SYMBOL	PARAMETER	TEST CONDITIONS	LIMITS			
			MIN	TYP	MAX	UNITS
I _{CC1}	V _{CC} supply current (active)	f _{SCL} = 400kHz; V _{CC} = +6V; SDA = Open; (for 2-Wire, Active, Read and Volatile Write States only)			3	mA
I _{CC2}	V _{CC} supply current (nonvolatile write)	f _{SCL} = 400kHz; V _{CC} = +6V; SDA = Open; (for 2-Wire, Active, Nonvolatile Write State only)			5	mA
I _{SB}	V _{CC} current (standby)	V _{CC} = +6V; V _{IN} = V _{SS} or V _{CC} ; SDA = V _{CC} ; (for 2-Wire, Standby State only)			5	μA
I _{LI}	Input leakage current	V _{IN} = V _{SS} to V _{CC}			10	μA
I _{LO}	Output leakage current	V _{OUT} = V _{SS} to V _{CC}			10	μA
V _{IH}	Input HIGH voltage		V _{CC} × 0.7			V
V _{IL}	Input LOW voltage				V _{CC} × 0.3	V
V _{OL}	Output LOW voltage	I _{OL} = 3mA			0.4	V
V _{OH}	Output HIGH voltage	I _{OH} = -1mA, V _{CC} ≥ +3V	V _{CC} - 0.8			V
V _{OH}	Output HIGH voltage	I _{OH} = -0.4mA, V _{CC} ≤ +3V	V _{CC} - 0.4			V

Endurance and Data Retention

PARAMETER	MIN	UNITS
Minimum endurance	100,000	Data changes per bit per register
Data retention	100	years

Capacitance

SYMBOL	TEST	MAX	UNITS	TEST CONDITIONS
C _{IN/OUT} (Note 15)	Input / Output capacitance (SDA)	8	pF	V _{OUT} = 0V
C _{IN} (Note 15)	Input capacitance (SCL, \overline{WP} , A2, A1 and A0)	6	pF	V _{IN} = 0V

Power-up Timing

SYMBOL	PARAMETER	MIN	MAX	UNITS
t _{r VCC} (Note 15)	V _{CC} Power-up rate	0.2		V/ms
t _{PUR} (Note 16)	Power-up to initiation of read operation		1	ms
t _{PUW} (Note 16)	Power-up to initiation of write operation		50	ms

AC Test Conditions

Input Pulse Levels	V _{CC} × 0.1 to V _{CC} × 0.9
Input rise and fall times	10ns
Input and output timing level	V _{CC} × 0.5

NOTES:

- This parameter is not 100% tested
- t_{PUR} and t_{PUW} are the delays required from the time the power supply (V_{CC}) is stable until the specific instruction can be issued. These parameters are periodically sampled and not 100% tested.

Equivalent AC Load Circuit

AC Timing

SYMBOL	PARAMETER	MIN	MAX	UNITS
f_{SCL}	Clock Frequency		400	kHz
t_{CYC}	Clock Cycle Time	2500		ns
t_{HIGH}	Clock High Time	600		ns
t_{LOW}	Clock Low Time	1300		ns
$t_{SU:STA}$	Start Setup Time	600		ns
$t_{HD:STA}$	Start Hold Time	600		ns
$t_{SU:STO}$	Stop Setup Time	600		ns
$t_{SU:DAT}$	SDA Data Input Setup Time	100		ns
$t_{HD:DAT}$	SDA Data Input Hold Time	30		ns
t_R	SCL and SDA Rise Time		300	ns
t_F	SCL and SDA Fall Time		300	ns
t_{AA}	SCL Low to SDA Data Output Valid Time		0.9	μ s
t_{DH}	SDA Data Output Hold Time	0		ns
T_I	Noise Suppression Time Constant at SCL and SDA inputs	50		ns
t_{BUF}	Bus Free Time (Prior to Any Transmission)	1200		ns
$t_{SU:WPA}$	A0, A1 Setup Time	0		ns
$t_{HD:WPA}$	A0, A1 Hold Time	0		ns

High-Voltage Write Cycle Timing

SYMBOL	PARAMETER	TYP	MAX	UNITS
t_{WR}	High-voltage write cycle time (store instructions)	5	10	ms

XDCP Timing

SYMBOL	PARAMETER	MIN	MAX	UNITS
t_{WRPO}	Wiper response time after the third (last) power supply is stable	5	10	μ s
t_{WRL}	Wiper response time after instruction issued (all load instructions)	5	10	μ s

Symbol Table

WAVEFORM	INPUTS	OUTPUTS
	Must be steady	Will be steady
	May change from Low to High	Will change from Low to High
	May change from High to Low	Will change from High to Low
	Don't Care: Changes Allowed	Changing: State Not Known
	N/A	Center Line is High Impedance

Applications Information

Basic Configurations of Electronic Potentiometers

Three-terminal Potentiometer;
Variable voltage divider

Two-terminal Variable Resistor;
Variable current

Application Circuits

Non inverting Amplifier

$$V_O = (1 + R_2/R_1)V_S$$

Voltage Regulator

$$V_O (\text{REG}) = 1.25V (1 + R_2/R_1) + I_{\text{adj}} R_2$$

Offset Voltage Adjustment

Comparator with Hysteresis

$$V_{UL} = \{R_1/(R_1 + R_2)\} V_O(\text{max})$$

$$V_{LL} = \{R_1/(R_1 + R_2)\} V_O(\text{min})$$

Application Circuits (continued)

Attenuator

$V_O = G V_S$
 $-1/2 \leq G \leq +1/2$

Filter

$G_0 = 1 + R_2/R_1$
 $f_c = 1/(2\pi RC)$

Inverting Amplifier

$V_O = G V_S$
 $G = -R_2/R_1$

Equivalent L-R Circuit

$Z_{IN} = R_2 + s R_2 (R_1 + R_3) C_1 = R_2 + s L_{eq}$
 $(R_1 + R_3) \gg R_2$

Function Generator

frequency $\propto R_1, R_2, C$
 amplitude $\propto R_A, R_B$

Revision History

The revision history provided is for informational purposes only and is believed to be accurate, but not warranted. Please go to the web to make sure that you have the latest revision.

DATE	REVISION	CHANGE
December 12, 2014	FN8169.6	<p>Updated Datasheet to Intersil new standards.</p> <p>Updated Ordering Information Table on page 2, by removing obsoleted parts and 100kΩ referenced parts, adding Note 3 and changed TSSOP POD references from "MDP0044" to "M24.173".</p> <p>On page 3, in the Pin Descriptions table removed duplicate entry for Pin 6.</p> <p>Added Revision History and About Intersil Verbiage</p> <p>Updated M24.3 POD to the latest revision.</p> <p>-"Updated to new POD standard by removing table listing dimensions and putting dimensions on drawing. Added Land Pattern."</p> <p>Replaced MDP0044 POD with M24.173 POD to update to new format and only show 24LD version.</p>

About Intersil

Intersil Corporation is a leading provider of innovative power management and precision analog solutions. The company's products address some of the largest markets within the industrial and infrastructure, mobile computing and high-end consumer markets.

For the most updated datasheet, application notes, related documentation and related parts, please see the respective product information page found at www.intersil.com.

You may report errors or suggestions for improving this datasheet by visiting www.intersil.com/ask.

Reliability reports are also available from our website at www.intersil.com/support

All trademarks and registered trademarks are the property of their respective owners.

For additional products, see www.intersil.com/en/products.html

Intersil products are manufactured, assembled and tested utilizing ISO9001 quality systems as noted in the quality certifications found at www.intersil.com/en/support/qualandreliability.html

Intersil products are sold by description only. Intersil may modify the circuit design and/or specifications of products at any time without notice, provided that such modification does not, in Intersil's sole judgment, affect the form, fit or function of the product. Accordingly, the reader is cautioned to verify that datasheets are current before placing orders. Information furnished by Intersil is believed to be accurate and reliable. However, no responsibility is assumed by Intersil or its subsidiaries for its use; nor for any infringements of patents or other rights of third parties which may result from its use. No license is granted by implication or otherwise under any patent or patent rights of Intersil or its subsidiaries.

Package Outline Drawing M24.3

24 LEAD WIDE BODY SMALL OUTLINE PLASTIC PACKAGE (SOIC)

Rev 2, 3/11

TOP VIEW

SIDE VIEW "A"

SIDE VIEW "B"

TYPICAL RECOMMENDED LAND PATTERN

NOTES:

1. Dimensioning and tolerancing per ANSI Y14.5M-1982.
2. Package length does not include mold flash, protrusions or gate burrs. Mold flash, protrusion and gate burrs shall not exceed 0.15mm (0.006 inch) per side.
3. Package width does not include interlead flash or protrusions. Interlead flash and protrusions shall not exceed 0.25mm (0.010 inch) per side.
4. The chamfer on the body is optional. If it is not present, a visual index feature must be located within the crosshatched area.
5. Terminal numbers are shown for reference only.
6. The lead width as measured 0.36mm (0.014 inch) or greater above the seating plane, shall not exceed a maximum value of 0.61mm (0.024 inch).
7. Controlling dimension: MILLIMETER. Converted inch dimensions in () are not necessarily exact.
8. This outline conforms to JEDEC publication MS-013-AD ISSUE C.
