

## Low Power Supply LDO Regulators (Ultra Small Packages)

### ■ GENERAL DESCRIPTION

XC6218 series are highly precise, low noise, positive voltage LDO regulators manufactured using CMOS processes. The series achieves very low supply current,  $1.0\mu\text{A}$  (TYP.) and consists of a reference voltage source, an error amplifier, current limit circuit, and a phase compensation circuit plus a driver transistor.

Ultra small USP-3 and SSOT-24 packages make high density mounting possible. Therefore, the series is ideal for applications where high density mounting is required such as in mobile phones.

Output voltage is selectable in 0.1V increments within a range of  $0.9\text{V}\sim 4.0\text{V}$  by laser trimming. The series is also compatible with low ESR ceramic capacitors ( $C_L$ ), which give added output stability.

The current limiter's fold-back circuit also operates as a short protect for the output current limiter and the output pin.

### ■ APPLICATIONS

- Portable audios
- Cordless phones,  
Wireless communication equipment
- Portable games
- Digital still camera, Digital video recorders
- Mobile phones
- Portable multimedia players
- PDAs

### ■ FEATURES

- Maximum Output Current** :  $200\text{mA}$  ( $300\text{mA}$  Limit: TYP.)  
(@  $V_{\text{OUT}}=3.0\text{V}$ ,  $V_{\text{IN}}=4.0\text{V}$ )
- Dropout Voltage** :  $200\text{mV}$ @  $I_{\text{OUT}}=100\text{mA}$   
(@  $V_{\text{OUT}}=3.0\text{V}$ )
- Operating Voltage Range** :  $1.5\text{V} \sim 6.0\text{V}$
- Output Voltage** :  $0.9 \sim 4.0\text{V}$  (0.1V increments)
- High Accuracy** : Setting Voltage Accuracy  $\pm 2\%$   
( $1.5 < V_{\text{OUT(T)}} \leq 4.0\text{V}$ )  
Setting Voltage Accuracy  $\pm 30\text{mV}$   
( $0.9 \leq V_{\text{OUT(T)}} \leq 1.5\text{V}$ )
- Low Power Supply** :  $1.0\mu\text{A}$  (TYP.)
- Operating Ambient Temperature** :  $-40^\circ\text{C} \sim 85^\circ\text{C}$
- External Capacitor** :  $0.1\mu\text{F} \sim 1.0\mu\text{F}$
- Packages** : USP-3, SSOT-24

## TEST CIRCUITS

### ● Circuit ①

### ● Circuit ②

## ■ OPERATIONAL EXPLANATION

### <Output Voltage Regulator Control>

The XC6218 series consists of a reference voltage source, an error amplifier, current limit circuit, and a phase compensation circuit plus a driver transistor. The voltage, divided by resistors R11 & R12, which are connected to the VOUT pin is compared with the internal reference voltage by the error amplifier. The P-channel MOSFET, which is connected to the VOUT pin, is then driven by the subsequent output signal. The output voltage at the VOUT pin is controlled & stabilized by negative feedback. The current limit circuit and short circuit protection operate in relation to the level of output current.

### <Current Limit, Short-Circuit Protection>

The XC6218 series includes a current limit circuit, which aid the operations of the current limiter and short-circuit protection. When the load current reaches the current limit level (300mA, TYP.), the current limiter circuit operates and output voltage drops. The circuit operates to decrease the current limit as the load impedance decreases further and the output voltage drops. When the output pin is shorted, a current of about 50mA flows.

## ■ NOTES ON USE

1. Please use this IC within the stated absolute maximum ratings. The IC is liable to malfunction should the ratings be exceeded.
2. Where wiring impedance is high, operations may become unstable due to noise and/or phase lag depending on output current.
3. The XC6218 series oscillates normally even without an input capacitor, C<sub>IN</sub>, or an output capacitor, C<sub>L</sub>, because the series compensates by the phase compensation circuit. However, when an input wiring is long, about 0.1 μF to 1.0 μF of the input capacitor, C<sub>IN</sub>, is required for stabilizing input. When an under-shoot or over-shoot is large at transient response, about 0.1 μF to 1.0 μF of output capacitor, which prevents output fluctuation occurred by load fluctuation, is also recommended. Please wire the input capacitor (C<sub>IN</sub>) and the output capacitor (C<sub>L</sub>) as close to the IC as possible. Please wire the input capacitor (C<sub>IN</sub>) and the output capacitor (C<sub>L</sub>) as close to the IC as possible.
4. When the input voltage starts from 0V, over-shoot may occur because of the slope of the input rising. In order to avoid the over-shoot, please use the IC by setting the slope of the input rising within 0.1V/ms.
