

-16V Input Three Terminal Negative Voltage Regulator

■ GENERAL DESCRIPTION

The XC6902 Series is a negative voltage CMOS regulator which includes a reference voltage source, error amplifiers, driver transistors, current limiters and phase compensators.

XC6902 is a 3 terminal negative voltage regulator (without CE pin) which is capable of accepting -16V input.

The over current protection circuit will operate when the output current reaches limit current. The thermal shutdown circuit will operate when the junction temperature reaches limit temperature.

■ APPLICATIONS

- Negative power supplies
- Modules (Wireless LAN, Digital still cameras, etc)
- Digital still cameras
- Mobile devices / terminals

■ FEATURES

Maximum Output Current	: 200mA
Input Voltage Range	: -2.4 ~ -16V
Output Voltage Range	: -2.5V,-2.6V,-3.0V,-3.3V,-4.0V,-4.5V,-5.0V,-6.0V,-12.0V
Accuracy	: $\pm 1.5\%$ for -2.0V~-12V
Temperature Stability	: TYP. $\pm 50\text{ppm}/^\circ\text{C}$
Dropout Voltage	: 400mV@ $I_{\text{OUT}}=100\text{mA}$
Low Power Consumption	: 100 μA
Protection Circuits	: Current Limit 350mA TYP. Foldback Thermal Shutdown (150°C)
Output Capacitor	: Ceramic Capacitor Compatible
Operating Ambient Temperature	: $-40^\circ\text{C}\sim+85^\circ\text{C}$
Packages	: SOT-23, SOT-89, USP-6C
Environmentally Friendly	: EU RoHS Compliant, Pb Free

■ TYPICAL APPLICATION CIRCUIT

■ TYPICAL PERFORMANCE CHARACTERISTICS

PIN CONFIGURATION

* The dissipation pad for the USP-6C package should be solder-plated in recommended mount pattern and metal masking to enhance mounting strength and heat release. If the pad needs to be connected to other pins, it should be connected to the -V_{IN} (No. 3) pin.

PIN ASSIGNMENT

PIN NUMBER			PIN NAME	FUNCTIONS
USP-6C	SOT-23	SOT-89		
3	3	2	-V _{IN}	Negative Supply Input
1	1	3	-V _{OUT}	Negative Output
6	2	1	GND	Ground
2,4,5	-	-	NC	No Connection

■ PRODUCT CLASSIFICATION

● Ordering Information

NOTE:

The test condition for input voltage, Unless otherwise stated, GND=0V, V_{IN}=V_{OUT(T)}-1.0V or -2.4V.

*1) V_{OUT(T)}: Nominal output voltage

*2) V_{OUT(E)}: Effective output voltage (see the voltage chart)

(ie. The output voltage when “V_{OUT(T)}-1.0V” or “-2.4V” is provided at the V_{IN} pin while maintaining a certain I_{OUT} value.

*3) V_{dif}={V_{IN1}-V_{OUT1}}

V_{IN1} is the input voltage when V_{OUT1} appears at the V_{OUT} pin while input voltage is gradually increased

V_{OUT1} is the voltage equal to 98% of the normal output voltage when amply stabilized V_{OUT(T)} -1.0V or -2.4V (the bigger absolute value one) are input at the V_{IN} pin.

*4) The maximum current may not be able to flow when thermal shutdown operates, it depends on power dissipation.

*5) E-1: Refer to Dropout Voltage Chart.

*6) Input voltage condition is V_{IN}=0V → V_{OUT}-1V with 5μs rising time.

Soft-start time t_{SS} is defined as the time taken from the 90% rising of V_{IN} to the 95% rising of V_{OUT(E)}.

■ TEST CIRCUIT

1) CIRCUIT①

2) CIRCUIT②

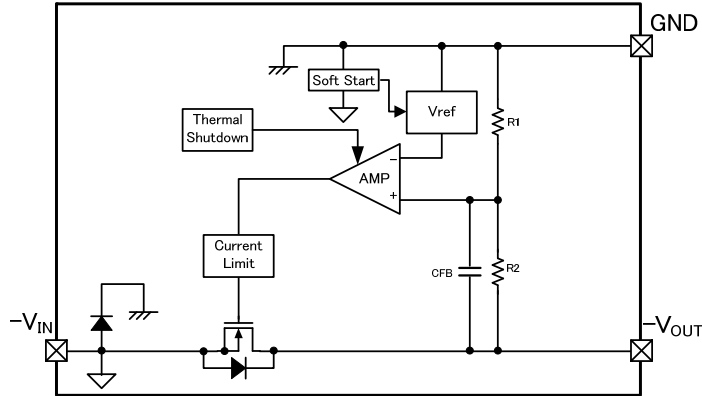

3) CIRCUIT③

OPERATIONAL EXPLANATION

The voltage divided by resistors R1 and R2 is compared with the internal reference voltage based on ground by the error amplifier.

The driver transistor tied to the $-V_{IN}$ pin is then driven by the subsequent output signal. The output voltage at the $-V_{OUT}$ pin is controlled and stabilized by a system of negative feedback.

XC6902 Series

< Soft-Start Function >

The XC6902 series includes soft-start circuit. During power start-up, the inrush current from $-V_{IN}$ pin to V_{OUT} pin to charge C_L capacitor can be reduced and it makes the V_{IN} stable. Soft-start time (t_{SS}) is optimized internally.

Figure1: Soft-Start Time and Inrush Current

< Current Limiter, Short-Circuit Protection >

The XC6902 series fold-back circuit operates as an output current limiter and a short protection circuit for the output pin. When the output current reaches the current limit level, output voltage drops with the decrease of the output current.

There are no parasitic diode between the $-V_{OUT}$ pin and GND pin. The minimized short-circuit current is maintained even if the $-V_{OUT}$ pin voltage is pulled up toward positive.

< Thermal Shutdown >

The XC6902 Series has an internal thermal shutdown (TSD) circuit for protection against overheating.

When the junction temperature reaches the detection temperature, the driver transistor is forcibly turned off. When the junction temperature falls to the release temperature with the driver transistor still in the off state, the driver transistor turns on (automatic recovery) and restarts regulator operation.

■ OPERATIONAL EXPLANATION (Continued)

<Low ESR Capacitor>

With the XC6902 series, a stable output voltage is achievable even if used with low ESR capacitors, as a phase compensation circuit is built-in. The output capacitor (C_L) should be connected as close to V_{OUT} pin and GND pin to obtain stable phase compensation. Values required for the phase compensation are as the table below.

For a stable power input, please connect an input capacitor (C_{IN}) near power supply. In order to ensure the stable phase compensation while avoiding run-out of values, please use the capacitor (C_{IN} , C_L) which does not depend on bias or temperature too much. The table below shows recommended values of C_{IN} , C_L .

CHART 1 : Recommended Values of C_{IN} , C_L

OUTPUT VOLTAGE RANGE	INPUT CAPACITOR	OUTPUT CAPACITOR
$V_{OUT(T)}$	C_{IN}	C_L
-0.9V~-12V	1.0 μ F~	1.0 μ F~100 μ F

■ NOTES ON USE

1. Please use this IC within the stated maximum ratings. For temporary, transitional voltage drop or voltage rising phenomenon, the IC is liable to malfunction should the ratings be exceeded.
2. Where wiring impedance is high, operations may become unstable due to noise and/or phase lag depending on output current. Please keep the resistance low for the $-V_{IN}$ and GND wiring in particular.
3. Please wire the C_{IN} and C_L as close to the IC as possible.
4. Capacitances of these capacitors (C_{IN} , C_L) are decreased by the influences of bias voltage and ambient temperature. Care shall be taken for capacitor selection to ensure stability of phase compensation from the point of ESR influence.
5. Torex places an importance on improving our products and its reliability.
However, by any possibility, we would request user fail-safe design and post-aging treatment on system or equipment.

●SOT-23 Power Dissipation

Power dissipation data for the SOT-23 is shown in this page.
 The value of power dissipation varies with the mount board conditions.
 Please use this data as one of reference data taken in the described condition.

1. Measurement Condition (Reference data)

Condition : Mount on a board
 Ambient : Natural convection
 Soldering : Lead (Pb) free

Board : Dimensions 40×40mm (1600mm² in one side)
 Copper (Cu) traces occupy 50% of the board area
 In top and back faces
 Package heat-sink is tied to the copper traces
 (Board of SOT-26 is used)

Material : Glass Epoxy (FR-4)
 Thickness : 1.6mm
 Through-hole : 4 x 0.8 Diameter

Evaluation Board (Unit: mm)

2. Power Dissipation vs. Ambient temperature

Board Mount (Tjmax=125°C)

Ambient Temperature (°C)	Power Dissipation Pd (mW)	Thermal Resistance (°C/W)
25	500	200.00
85	200	

●SOT-89 Power Dissipation

Power dissipation data for the SOT-89 is shown in this page.
The value of power dissipation varies with the mount board conditions.
Please use this data as one of reference data taken in the described condition.
