## MMIC

# REFLECTIONLESS FILTERS

 $50\Omega$  DC to 21 GHz

## The Big Deal

- High Stopband rejection, up to 50 dB
- Patented design terminates stopband signals
- Pass band cut-off up to 14 GHz
- Stop band up to 40 GHz
- Excellent repeatability through IPD\* process

#### **Product Overview**

Mini-Circuits' *X-Series* of reflectionless filters now includes 2, 3, & 4-section models, giving you ultra-high rejection in the stopband – up to 50 dB! Reflectionless filters employ a patented filter topology which absorbs and terminates stopband signals internally rather than reflecting them back to the source. This new capability enables unique applications for filter circuits beyond those suited to traditional approaches. Traditional filters are reflective in the stopband, sending signals back to the source at 100% power. These reflections interact with neighboring components and often result in intermodulation and other interferences. By eliminating stopband reflections, reflectionless filters can readily be paired with sensitive devices and used in applications that otherwise require circuits such as isolation amplifiers or attenuators.

| Key Features  | Advantages   |  |  |
|---|--|--|--|
| Easy integration with sensitive reflective components, e.g. mixers, multipliers | Reflectionless filters absorb unwanted signals, preventing reflections back to the source. This reduces generation of additional unwanted signals without the need for extra components like attenuators, improving system dynamic range and saving board space. |  |  |
| High stopband rejection, up to 50 dB  | Ideal for applications where suppression of strong spurious signals and intermodulation products is needed.  |  |  |
| Enables stable integration of wideband amplifiers                               | Because reflectionless filters maintain good impedance in the stopband; they can be integrated with high gain, wideband amplifiers without the risk of creating instabilities in these out of band regions.  |  |  |
| Cascadable  | Reflectionless filters can be cascaded in multiple sections to provide sharper and higher attenuation, while also preventing any standing waves that could affect passband signals. Low & highpass filters can be cascaded to realize bandpass filters.          |  |  |
| Excellent power handling in a tiny surface mount device up to 7W in passband    | High power handling extends the usability of these filters to the transmit path for inter-stage filtering.   |  |  |
| Excellent repeatability of RF performance                                       | Through semiconductor IPD process, X-series filters are inherently repeatable for large volume production.   |  |  |
| Excellent stability over temperature  | With ±0.3 dB variation over temperature ideal for use in wide temperature range applications without the need for additional temperature compensation.   |  |  |
| Operating temperature up to 105°C   | Suitable for operation close to high power components.   |  |  |

<sup>\*</sup>IPD – Integrated Passive Device, is a GaAs semiconductor process

# Reflectionless High Pass Filter

### XHF-63M+

#### 50Ω 5900 to 19000 MHz

#### **Features**

- Match to  $50\Omega$  in the stop band, eliminates undesired reflections
- Cascadable
- Good stopband rejection, 42 dB typ.
- Temperature stable, up to 105°C
- Small size, 3 x 3 mm
- Protected by US Patents 8,392,495; 9,705,467, additional patent pending
- Protected by China Patent 201080014266.1
- Protected by Taiwan Patent I581494

#### **Applications**

- Fixed Satellite
- Mobile
- · Space research

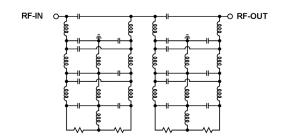

+RoHS Compliant
The +Suffix identifies RoHS Compliance. See our web site for RoHS Compliance methodologies and qualifications

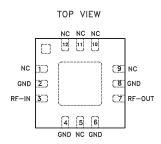

#### **General Description**

Mini-Circuits' XHF-63M+ two-section reflectionless filter employs a novel filter topology which absorbs and terminates stop band signals internally rather than reflecting them back to the source. This new capability enables unique applications for filter circuits beyond those suited to traditional approaches. Traditional filters are reflective in the stop band, sending signals back to the source at 100% of the power level. These reflections interact with neighboring components and often result in inter-modulation and other interferences. Reflectionless filters eliminate stop band reflections, allowing them to be paired with sensitive devices and used in applications that otherwise require circuits such as isolation amplifiers or attenuators.

#### simplified schematic and pad description

| Function            | Pad<br>Number | Description            |  |
|---------------------|---------------|------------------------|--|
| RF-IN               | 3             | RF Input Pad           |  |
| RF-OUT              | 7             | RF Output Pad          |  |
| GND                 | 2,4,6,8       | Connected to ground    |  |
| NC (GND Externally) | 1, 5,9-12     | No internal connection |  |
