

Features

Inputs/Outputs

- Accepts differential or single-ended input
 - LVPECL, LVDS, CML, HCSL, LVCMOS
- On-chip input termination and biasing for AC coupled inputs
- Eight precision LVDS outputs
- Operating frequency up to 750 MHz

Power

- Options for 2.5 V or 3.3 V power supply
- Current consumption of 112 mA
- On-chip Low Drop Out (LDO) Regulator for superior power supply rejection

Performance

- Ultra low additive jitter of 135 fs RMS

Ordering Information

ZL40219LDG1	32 Pin QFN	Trays
ZL40219LDF1	32 Pin QFN	Tape and Reel
Matte Tin		
Package size: 5 x 5 mm		
-40°C to +85°C		

Applications

- General purpose clock distribution
- Low jitter clock trees
- Logic translation
- Clock and data signal restoration
- Wired communications: OTN, SONET/SDH, GE, 10 GE, FC and 10G FC
- Wireless communications
- High performance micro-processor clock distribution

9, 19, 22, 32	vdd	Positive Supply Voltage. 2.5 V _{DC} or 3.3 V _{DC} nominal.
1, 8	vdd_core	Positive Supply Voltage. 2.5 V _{DC} or 3.3 V _{DC} nominal.
2, 7, 20, 21	gnd	Ground. 0 V.
4	vt	On-Chip Input Termination Node (Analog). Center tap between internal 50 Ohm termination resistors. The use of this pin is detailed in section “Clock Inputs” on page 6, for various input signal types.
5	ctrl	Digital Control for On-Chip Input Termination (Input). Selects differential input mode; 0: DC coupled LVPECL or LVDS modes 1: AC coupled differential modes This pin is internally pulled down to GND. The use of this pin is detailed in section “Clock Inputs” on page 6, for various input signal types.
10, 31	NC	No Connection. Leave unconnected.

3.0 Functional Description

The ZL40219 is an LVDS clock fanout buffer with eight output clock drivers capable of operating at frequencies up to 750MHz.

The ZL40219 provides an internal input termination network for DC and AC coupled inputs; optional input biasing for AC coupled inputs is also provided. The ZL40219 can accept DC or AC coupled LVPECL and LVDS input signals, AC coupled CML or HCSL input signals, and single ended signals. A pin compatible device with external termination is also available.

The ZL40219 is designed to fan out low-jitter reference clocks for wired or optical communications applications while adding minimal jitter to the clock signal. An internal linear power supply regulator and bulk capacitors minimize additive jitter due to power supply noise. The device operates from 2.5V \pm 5% or 3.3V \pm 5% supply. Its operation is guaranteed over the industrial temperature range -40°C to +85°C.

The device block diagram is shown in Figure 1; its operation is described in the following sections.

3.1 Clock Inputs

The device has a differential input equipped with two on-chip 50 Ohm termination resistors arranged in series with a center tap. The input can accept many differential and single-ended signals with AC or DC coupling as appropriate. A control pin is available to enable internal biasing for AC coupled inputs. A block diagram of the input stage is in Figure 3.

Figure 3 - Simplified Diagram of input stage

The following figures give the components values and configuration for the various circuits compatible with the input stage and the use of the *Vt* and *ctrl* pins in each case.

In the following diagrams where the *ctrl* pin is logically one and the *Vt* pin is not connected, the *Vt* pin can be instead connected to VDD with a capacitor. A capacitor can also help in Figure 4 between *Vt* and VDD. This capacitor will minimize the noise at the point between the two internal termination resistors and improve the overall performance of the device.

Figure 11 - Clock Input - DC-coupled 3.3V CMOS

3.2 Clock Outputs

LVDS has lower signal swing than LVPECL which results in a low power consumption. A simplified diagram for the LVDS output stage is shown in Figure 12.

Figure 12 - Simplified LVDS Output Driver

The methods to terminate the ZL40219 drivers are shown in the following figures.

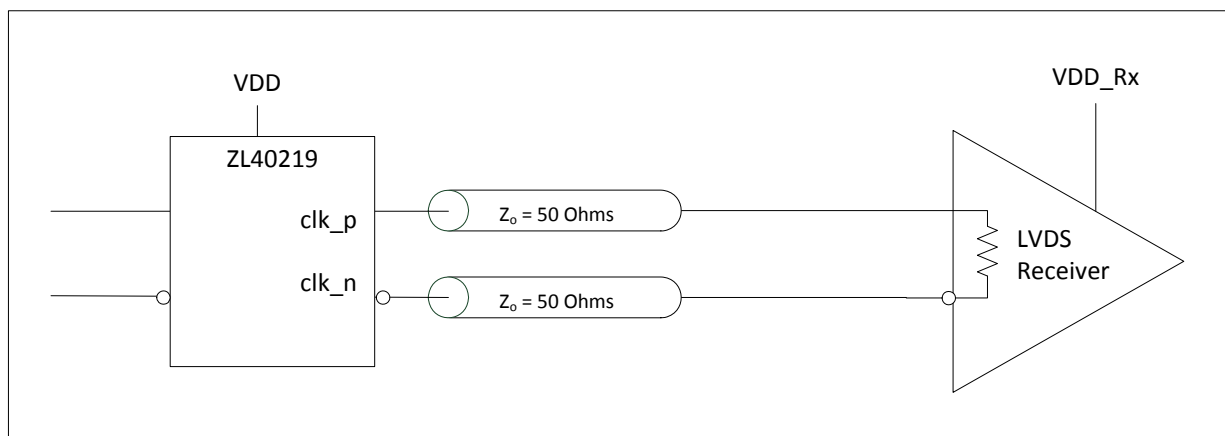

Figure 13 - LVDS DC Coupled Termination (Internal Receiver Termination)

Figure 14 - LVDS DC Coupled Termination (External Receiver Termination)

Note: R1 and R2 values and need for external termination depend on the specification of the LVDS receiver

Figure 15 - LVDS AC Coupled Termination

Figure 16 - LVDS AC Output Termination for CML Inputs

3.3 Device Additive Jitter

The ZL40219 clock fanout buffer is not intended to filter clock jitter. The jitter performance of this type of device is characterized by its additive jitter. Additive jitter is the jitter the device would add to a hypothetical jitter-free clock as it passes through the device. The additive jitter of the ZL40219 is random and as such it is not correlated to the jitter of the input clock signal.

The square of the resultant random RMS jitter at the output of the ZL40219 is equal to the sum of the squares of the various random RMS jitter sources including: input clock jitter; additive jitter of the buffer; and additive jitter due to power supply noise. There may be additional deterministic jitter sources, but they are not shown in Figure 17.

Figure 17 - Additive Jitter

3.4 Power Supply

This device operates employing either a 2.5V supply or 3.3V supply.

3.4.1 Sensitivity to power supply noise

Power supply noise from sources such as switching power supplies and high-power digital components such as FPGAs can induce additive jitter on clock buffer outputs. The ZL40219 is equipped with an on-chip linear power regulator and on-chip bulk capacitors to minimize additive jitter due to power supply noise. The on-chip measures in combination with the simple recommended power supply filtering and PCB layout minimize additive jitter from power supply noise.

3.4.2 Power supply filtering

Jitter levels may increase when noise is present on the power pins. For optimal jitter performance, the device should be isolated from the power planes connected to its power supply pins as shown in Figure •.

- 10 μF capacitors should be size 0603 or size 0805 X5R or X7R ceramic, 6.3 V minimum rating
- 0.1 μF capacitors should be size 0402 X5R ceramic, 6.3 V minimum rating
- Capacitors should be placed next to the connected device power pins
- A 0.3 ohm resistor is recommended

Figure 18 - Decoupling Connections for Power Pins

3.4.3 PCB layout considerations

The power nets in Figure 18 can be implemented either as a plane island or routed power topology without effect overall jitter performance of the device.

4.0 AC and DC Electrical Characteristics

Absolute Maximum Ratings*

	Parameter	Sym.	Min.	Max.	Units
1	Supply voltage	V_{DD_R}	-0.5	4.6	V
2	Voltage on any digital pin	V_{PIN}	-0.5	V_{DD}	V
3	Soldering temperature	T		260	°C
4	Storage temperature	T_{ST}	-55	125	°C
5	Junction temperature	T_j		125	°C
6	Voltage on input pin	V_{input}		V_{DD}	V
7	Input capacitance each pin	C_p		500	fF

* Exceeding these values may cause permanent damage. Functional operation under these conditions is not implied.

* Voltages are with respect to ground (GND) unless otherwise stated

Recommended Operating Conditions*

	Characteristics	Sym.	Min.	Typ.	Max.	Units
1	Supply voltage 2.5 V mode	V_{DD25}	2.375	2.5	2.625	V
2	Supply voltage 3.3 V mode	V_{DD33}	3.135	3.3	3.465	V
3	Operating temperature	T_A	-40	25	85	°C

* Voltages are with respect to ground (GND) unless otherwise stated

DC Electrical Characteristics - Current Consumption

	Characteristics	Sym.	Min.	Typ.	Max.	Units	Notes
1	Supply current LVDS drivers - loaded (all outputs are active)	I_{dd_load}		112		mA	

DC Electrical Characteristics - Inputs and outputs - for 2.5/3.3 V supply

	Characteristics	Sym.	Min.	Typ.	Max.	Units	Notes
1	CMOS control logic high-level input	V_{CIH}	$0.7 \cdot V_{DD}$			V	
2	CMOS control logic low-level input	V_{CIL}			$0.3 \cdot V_{DD}$	V	
3	CMOS control logic Input leakage current	I_{IL}		1		μA	$V_I = V_{DD}$ or 0 V
4	Differential common mode voltage	V_{ICM}	1.1		1.6	V	for 2.5 V
5	Differential common mode voltage	V_{ICM}	1.1		2.0	V	for 3.3 V
6	Differential input voltage difference	V_{ID}	0.25		1	V	
7	Differential input resistance	V_{IR}	80	100	120	ohm	
8	LVDS output differential voltage*	V_{OD}	0.25	0.30	0.40	V	

DC Electrical Characteristics - Inputs and outputs - for 2.5/3.3 V supply

	Characteristics	Sym.	Min.	Typ.	Max.	Units	Notes
9	LVDS Common Mode voltage	V_{CM}	1.1	1.25	1.375	V	

* The VOD parameter was measured between 125 and 750 MHz

Figure 19 - Differential Output Voltage Parameter

AC Electrical Characteristics* - Inputs and Outputs (see Figure 20) - for 2.5/3.3 V supply.

	Characteristics	Sym.	Min.	Typ.	Max.	Units	Notes
1	Maximum Operating Frequency	$1/t_p$			750	MHz	
2	input to output clock propagation delay	t_{pd}	0	1	2	ns	
3	output to output skew	$t_{out2out}$		80	150	ps	
4	part to part output skew	$t_{part2part}$		120	300	ps	
5	Output clock Duty Cycle degradation	t_{PWH}/ t_{PWL}	-5	0	5	Percent	
6	LVDS Output slew rate	r_{SL}	0.55			V/ns	

* Supply voltage and operating temperature are as per Recommended Operating Conditions

Figure 20 - Input To Output Timing

5.0 Performance Characterization

Additive Jitter at 2.5 V*

	Output Frequency (MHz)	Jitter Measurement Filter	Typical RMS (fs)	Notes
1	125	12 kHz - 20 MHz	184	
2	212.5	12 kHz - 20 MHz	174	
3	311.04	12 kHz - 20 MHz	157	
4	425	12 kHz - 20 MHz	152	
5	500	12 kHz - 20 MHz	139	
6	622.08	12 kHz - 20 MHz	138	
7	750	12 kHz - 20 MHz	135	

*The values in this table were taken with an approximate slew rate of 0.8 V/ns.

Additive Jitter at 3.3 V*

	Output Frequency (MHz)	Jitter Measurement Filter	Typical RMS (fs)	Notes
1	125	12 kHz - 20 MHz	187	
2	212.5	12 kHz - 20 MHz	176	
3	311.04	12 kHz - 20 MHz	156	
4	425	12 kHz - 20 MHz	153	
5	500	12 kHz - 20 MHz	140	
6	622.08	12 kHz - 20 MHz	139	
7	750	12 kHz - 20 MHz	137	

*The values in this table were taken with an approximate slew rate of 0.8 V/ns.

Additive jitter from a power supply tone*

Carrier frequency	Parameter	Typical	Units	Notes
125	25 mV at 100 kHz	33	fs RMS	
750	25 mV at 100 kHz	33	fs RMS	

* The values in this table are the additive periodic jitter caused by an interfering tone typically caused by a switching power supply. For this test, measurements were taken over the full temperature and voltage range for $V_{DD} = 3.3$ V. The magnitude of the interfering tone is measured at the DUT.

6.0 Typical Behavior

Typical Waveform at 155.52 MHz

V_{OD} vs Frequency

Power Supply Tone Frequency versus PSRR

Power Supply Tone Magnitude versus PSRR

Propagation Delay versus Temperature

Note: This is for a single device. For more details, see the characterization section.
