Designing Secure IoT Devices

Enhanced Security – DPA Countermeasures

LOCAL ATTACK VECTOR

1

A Differential Power Analysis (DPA) attack requires hands-on access to the device.

2

Monitoring electromagnetic radiation and fluctuations in power consumption during crypto operations may reveal security keys and other data.

■ Vulnerabilities

- Observing subtle differences during given internal operations can provide insight into cryptographic functions

■ DPA Countermeasures

- Countermeasures add masks and random timings to internal operations and distorts DPA snooping

E-Tamper

1 Tamper Pins on Case

2 Tamper Trace Around Comms Link

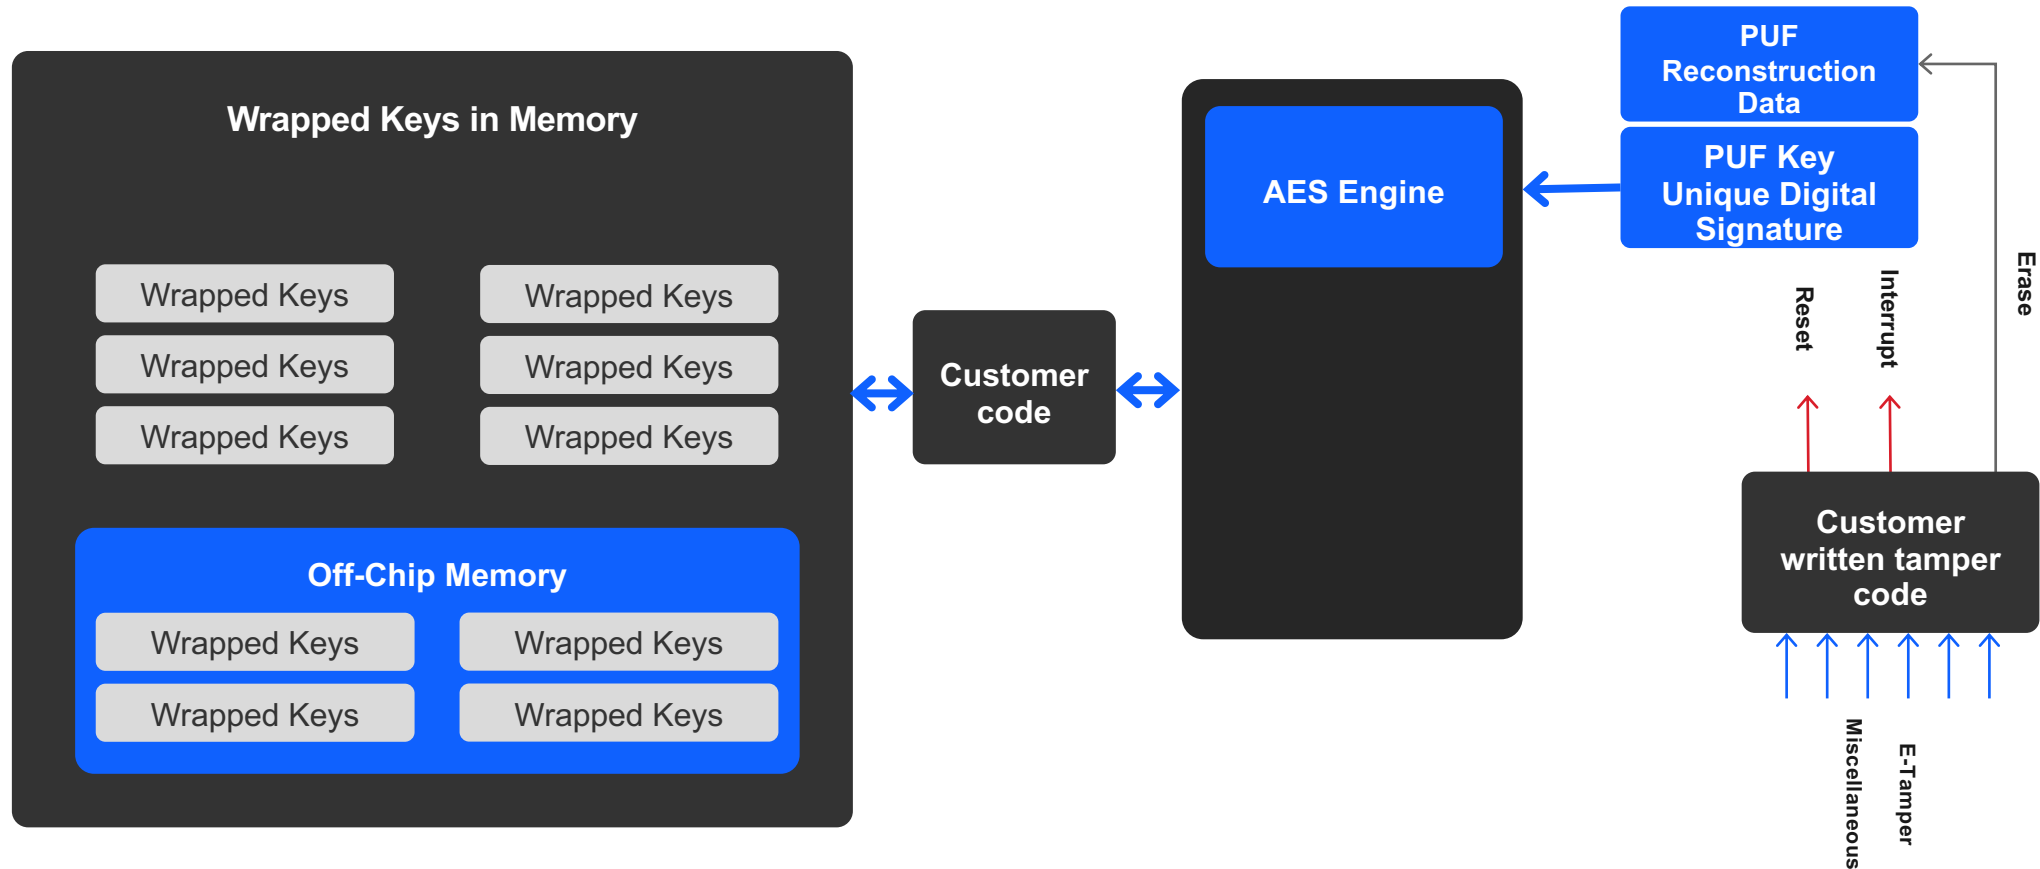

3

Purpose Built Tamper Shields

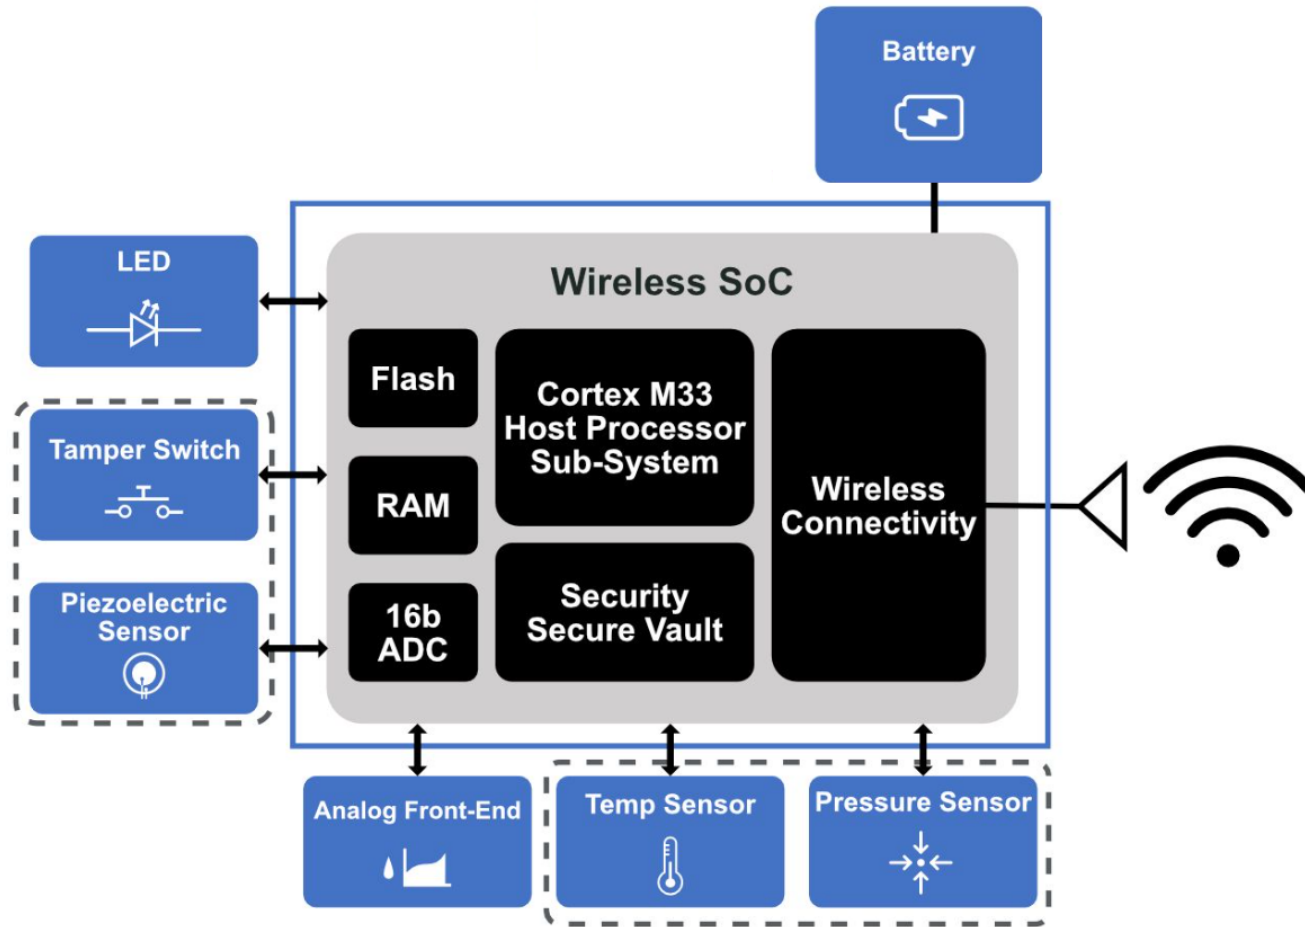

- **Square wave out one pin and in another – broken signal can be fed into other logic to take tamper action**
- **Uses Cases:**
 - 1) Connect Tamper Pins on a product case and then do trigger action when case opened
 - 2) Create Wire trace around bus in PC Board to protect communications between two components
 - 3) Power a tamper shield which can protect several components on a PCB

Enhanced Security - Customer Key Management with PUF

Example of Tiny Medical Device Design – Continuous Glucose Monitor

- **BG27 SoC Based**

- **Highlights**

- BG27 CSP Package / Size
- DCDC Buck/Boost
- Power Optimization
 - Low active and sleep current
 - Shelf Mode (BOOST_EN)
- Secure Vault
 - E-Tamper
- Analog/Serial Peripherals
 - 16-bit ADC
- CGM Sample Application
